Executive Summary

Statewide Planning Pty Ltd engaged Sullivan Environmental Sciences Pty Ltd to conduct a Detailed Site Contamination Assessment of the property at 741-755 Great Western Highway, Werrington NSW 2747. The site is earmarked for a proposed residential subdivision development comprising 134 housing lots, public roads and green spaces. The site is identified as Stage 4 of the greater development area known as Settlers Estate residential development.

The detailed site contamination assessment was necessary to address pre-lodgement advice received from Penrith City Council regarding land contamination matters identifying recent use of parts of the site as a works compound and other areas of the site used for stockpiling soils, both activities being a source of potential contamination.

Our objective was to assess for the presence of soil contamination at the site and provide conclusions on the suitability of the site for its proposed residential use or provide recommendations for additional investigation and/or remediation, if needed.

Our scope comprised an intrusive soil investigation and reporting in consideration of the contaminated land guidelines made or approved by NSW EPA under the Contaminated Land Management Act (NSW), SEPP55 planning guidelines, and the ASC NEPM 2013.

The following conclusions are made based on the findings of this Detailed Site Contamination Assessment; subject to the limitations presented in Section 9:

- The site is defined as Lot 125 & Lot 126 in DP1215199 at 741-755 Great Western Highway, Werrington NSW with an area of 4.898 hectares.
- It is proposed to subdivide the land for residential allotments with accessible gardens and soil. The site is identified as Stage 4 of the larger Settlers Estate Residential subdivision development.
- At present the site is generally vacant and unused. In the recent past the site was used as a works compound for earthworks and construction activities for the adjoining Settlers Estate development including Stages 1, 2 and 3. The site also contains stockpiles of soil originating from the adjoining development lands. These adjoining lands are also owned by the site owner (Statewide Planning).
- Historically the site was used for Defence activities as part of a larger property until 1999 when the Defence property was remediated and validated as suitable for residential uses with accessible soils. The site remained unused since 1999 and ownership was transferred in 2005.
- Recent site activities identified by Council as posing a potential contamination risk were considered to be limited to the entrance area of the site as a works compound and stockpiling of soil at various locations across the site. These activities and areas of the site formed the basis to the assessment.
- Sampling and analysis of soil samples collected from the works compound, from stockpiled soils and natural soil layers show concentrations of contaminants meeting the adopted investigation levels for land to be used for residential dwellings.
- The stockpiles visually and chemically are consistent with the natural virgin ground and are considered to be stockpiled natural soils. All stockpile results and calculated 95% UCLs are below the investigation criteria.
- Onsite soils, either stockpiled or at ground level, are unlikely to pose an unacceptable health risk to human or ecological receptors under a low-density residential land use setting.
- No actual or suspected Asbestos Containing Materials (ACMs) were observed during site works or analytically detected at the surface or in subsurface soils sampled onsite.
- The presence of minor amounts (i.e. visually estimated at <0.5%) of inert foreign matter in the soil stockpiles does not cause a contamination concern. The soils are considered suitable to be beneficially used on the residential development site.

- We consider that the adopted test-pitting and sampling approach has adequately characterised the stockpiles visually and chemically as natural materials; however, we recommend prior to reuse of the stockpiled soils, the stockpiles are suitably screened to remove foreign matter, for aesthetic considerations, to improve the visual appearance of the soils.

Based on the findings of the Detailed Site Contamination Assessment, recent activities on parts of the site used as a works compound and soil stockpiling areas have not caused contamination of the land and the site is considered suitable for the proposed subdivision development as residential land.

1

Introduction

Statewide Planning Pty Ltd (Statewide) engaged Sullivan Environmental Sciences Pty Ltd (Sullivan-ES) to conduct a Detailed Site Contamination Assessment of the property at 741-755 Great Western Highway, Werrington NSW 2747; henceforth referred to as 'the site'. A site locality map is shown on Figure 1 **Appendix A**.

We understand the site is earmarked for a proposed residential subdivision development comprising 134 housing lots, public roads and green spaces. The site is identified as Stage 4 of the greater development area known as Settlers Estate residential development.

The site has previously been remediated and validated in 1999. At that time, the site was part of a much larger property operated by Defence. The site was understood to be used as an army supply and signals depot. A previous contamination report (D&M 1999[1]) concluded that validation sampling of remediation undertaken at that time demonstrated that the site was suitable for residential land use with gardens and accessible soils. A subsequent Phase 1 investigation completed in 2012 (JBS 2012[2]) that stated again the conclusions by D&M 1999, that the site was suitable for residential uses, as well as concluding that the site remained relatively unchanged from the 1999 report.

Pre-lodgement advice received from Penrith City Council regarding land contamination matters identified recent use of parts of the site as a works compound and other areas of the site used for stockpiling soils, both activities being a source of potential contamination.

Assessment of land contamination is required under State Environmental Planning Policy No. 55 – Remediation of Land (SEPP55) for assessing a development application to be lodged for the subdivision.

1.1 Objective

Our objective was to assess whether recent activities on parts of the site as a works compound and soil stockpiling areas have caused contamination of the land, and to provide conclusions on the suitability of the site for its proposed subdivision for residential use or provide recommendations for additional investigation and/or remediation, if needed.

1.2 Scope of Work

Our scope of work comprised the following:

Information Review

- Reviewing site background information made available by Statewide.

Fieldwork

- Preparing a sampling work plan and safety plan for all field-based work on the site.
- Mobilising to the site and conducting a detailed site inspection to document current site conditions and surrounding environments.

[1] Dames and Moore Final Report Stage 2 Remediation & Validation, Kingswood Army Signals Depot, dated 27 October 1999 (not reviewed by Sullivan-ES).
[2] JBS Environmental Pty Ltd, Phase 1 Environmental Site Assessment, June 2012.

- Conducting a clearance of underground utilities using 'Dial Before You Dig' plans to clear and confirm soil sampling locations.
- Collecting soil samples from surface soils within the works compound area and from test pits excavated into soil stockpiles at various parts of the site.
- Returning to the site to collect additional soil samples from surface/near surface soils across broader areas of the site and from test pits excavated into other soil stockpiles.
- Dispatching collected samples of soil from both sampling events to a NATA accredited laboratory to be analysed for a broad suite of contaminants.

Reporting

Preparing a Detailed Site Contamination Assessment report in consideration of the contaminated land guidelines made or approved by NSW EPA under the Contaminated Land Management Act (NSW), SEPP55 planning guidelines, and the ASC NEPM 2013.

1.3 Regulatory Framework

The Contamination Assessment was conducted with consideration of the following regulatory framework and guideline documents. A full list of reference documents is presented in Section 8.

- Contaminated Land Management Act 1997 (CLM Act).
- National Environment Protection (Assessment of Site Contamination) Measure 2013 (ASC NEPM 2013).
- Contaminated Land Guidelines: Consultants Reporting on Contaminated Land, 2020 (NSW EPA 2020).
- Guidelines for the NSW Site Auditor Scheme (3rd Edition), 2017 (NSW EPA 2017).
- Sampling Design Guidelines, 1995 (NSW EPA 1995).
- State Environmental Planning Policy No.55 – Remediation of Land 1998 (SEPP55).
- Managing Land Contamination Planning Guidelines SEPP 55–Remediation of Land (the Planning Guidelines).

1.4 Consultant's Competency and Certification

All contamination assessment work and reporting was conducted by the professionally trained team at Sullivan-ES. The Project Team consisted of the following members:

1. Adam Sullivan who has over 20 years of experience in contaminated land assessment and remediation. Adam is a certified Site Contamination Specialist (CEnvP-SC) under the Certified Environmental Practitioner Scheme (www.cenvp.org) and has prepared and approved this report in the capacity as a CEnvP-SC and Principal Scientist.
2. Sean Guenther who has over 19 years of experience in contaminated land assessment and remediation and has reviewed this report in his capacity as Senior Associate.

2

Site Information

The information provided in this section is summarised from the following:

- Information provided by Statewide.
- Fieldwork observations and sampling undertaken by Sullivan-ES.

2.1 Site Description

2.1.1 Identification

The following information identifies the site.

Table 2-1 Site Identification

Attribute	Details
Address	741-755 Great Western Highway, Werrington NSW 2747
Legal identity	Lot 125 & Lot 126 DP 1215199
Area	4.898 hectares (Ref: ECP surveyors, Drawing A, 4/9/2020)
Owner/operator	Statewide Planning Pty Ltd
Local Government Area (LGA)	Penrith City Council
Zone	R3 Medium Density Residential – Penrith Local Environmental Plan 2010
Current land use	Vacant/Unused
Future land use	Residential subdivision, public roads and green spaces areas

2.1.2 Existing, Proposed and Surrounding Land Use

The site is zoned for medium density residential (Penrith LEP 2010) and currently exists as a vacant unused parcel. It is proposed to subdivide the site for residential lots, public roads and green space areas. General layout of the proposed development is presented in **Appendix F**.

The site is bordered by the following land uses.

North: Public road (St Charbel Boulevarde) then existing residential dwellings of the adjoining Settlers Estate development (zoned R1 General Residential).

South: Public road (Great Western Highway) then the existing TAFE NSW campus (zoned SP2).

East: An unnamed water course and future reserve land (zoned E2 Environmental Conservation) then land comprising the Stage 5 development area (zoned B7 Business Park).

West: Public road (French Street) then single-storey residential dwellings (zoned R3 Medium Density Residential).

2.1.3 Site Inspection and Condition

Sullivan-ES completed a detailed site inspection of the site on 30 November 2020. Specific site features are identified on Figure 2 of **Appendix A,** while site photos are presented in **Appendix D**. The following observations were made from the site inspection.

- Entry is gained through locked security gates off French Street. A hardstand cover consisting of crushed brick and concrete has been laid down across the site entrance area and adjoining works compound.
- Large portions of the site appear relatively consistent with natural ground levels with various equipment, storage materials and soil stockpiles placed on top, as described below.
- An internal access path continues on from the site entrance to the east then curves north to the northern site boundary. Hardstand has been laid down on the path consisting of crushed rock.
- The works compound consists of a few demountable sheds and shipping containers, as well as a few large excavator machines, a dump truck and other related equipment. Materials and equipment observed in this area included:
    - a small concrete slab upon which was stacked bricks, metal pipes and other construction materials;
    - excavator buckets and other attachments;
    - office chairs and table (from the demountable offices);
    - construction site signage;
    - rolls of polypipe;
    - metal plates and coverings;
    - a few empty drums (no labels) and plastic buckets;
    - an IBC containing oil residues (no observed staining beneath or on surrounding ground was noted); and
    - various other brick-a-brack.
- There is an external materials storage area laid out on the open ground immediately east of the works compound and further east into the site. Of note were the following materials:
    - stacked concrete stormwater pipes
    - reo metal mesh and lengths of reo bars
    - lengths of metal pipe and siding/guttering
    - large diameter PVC drainage pipes
    - an empty skip bin
    - tyres
    - stockpiles of concrete slabs, concrete rubble and brick
    - a few small piles of building material waste (timber, metal, insulation, etc).
- No fibro cement materials (potentially containing asbestos) were observed in any areas of the works compound or materials/equipment storage areas.
- A large soil stockpile has been formed along the eastern site boundary, labelled as Stockpile A on Figure 2.
- On the opposite side of the access path to Stockpile A is another large soil stockpile, labelled Stockpile B.
- All additional soil stockpiles are much smaller and are either standalone piles or a series of small piles (i.e. small tipper loads) adjoining each other.
- An elongated embankment has been formed along the southern side of the access path, while another embankment has been formed by a cutting along the north boundary along St Charbel Boulevarde.

No fibro cement materials (potentially containing asbestos) were observed on or in any stockpiled soils. Refer to soil logs (**Appendix C**) and Section 5.1 for descriptions of soil materials encountered during sampling.

All materials observed in the works compound area and civil machinery storage area appear inert in substance and are considered of no consequence to potentially contaminate the land, these locations were addressed in general housekeeping duties, as described in Section 2.5.

2.1.4 Anecdotal Information

Sullivan-ES was informed by the landowner that all soils stockpiled onsite originated from the adjoining residential development properties to the north that the landowner also owns and has or is in the process of developing those properties as residential dwellings, public roads and green spaces. The adjoining developments consist of the Stage 1, Stage 2 and Stage 3 works of Settlers Residential Estate.

Sullivan-ES verified this statement by reviewing Nearmap™ aerial images from 2015 to 2017. Aerial imagery during this timeframe show the development of the adjoining residential lands and corresponding soil stockpiling activities on the Stage 4 Site. After conducting the site inspection, it was evident that the site areas of concern have been exclusively used for construction related activities, which verifies the landowner's assertion of work activity relating to development of the Stage 1, 2 and 3 lands to the north.

2.2 Site History

Based on our review of the past report (Section 2.3), it is understood that the site history involved the following:

- The site was part of a larger parcel of Commonwealth land up until 2005 and then changed ownership.
- Up to 1994 the site (and associated Commonwealth land) was operated by the Department of Defence as an Army supply and signals depot.
- Between 1994 and 1999 the following activities occurred:
    - Demolition of all site buildings.
    - Assessment, remediation and validation works at the site including:
        - Removal of two USTs (in 1996 and 1998)
        - Former RTA asphalt plant in south east area
        - Dumping ground in north east area
        - Former building areas
        - French Street residences
- From 2005 the site ownership was transferred to the developer under various company entities for future subdivision and development.
- From 2015 to 2017 the site was used as a works compound and soil stockpiling area for the adjoining land development to the north consisting of Stage 1, 2 and 3 of Settlers Estate.

2.3 Previous Reports

JBS Environmental conducted a Phase 1 investigation in 2012 of a large 22-hectare parcel of land that included the site to *"…document the site history, assess potential on and offsite sources of contamination, and whether the site is suitable for the proposed use, or provide recommendations to enable such conclusions."* **Appendix E** presents the land area subject to the Phase 1 which included

the site as well as the parcels of land to the north now identified as Stage 1, 2 and 3 of the Settlers Estate development.

At the time of the Phase 1, the site was identified as Lot 57 and Lot 58 DP1069025 as shown in **Appendix E**.

JBS conducted a review of a previous contamination report (D&M 1999) and stated that *"The report provided was an extract of a report on remediation and validation by Dames & Moore (DM 1999)[1]. The document provided comprised the text of the report but did not include analytical results tables, figure or any appendices."* JBS also stated that *"It is further noted that the report (D&M 1999) states that "A remedial action plan was prepared and approved by an independent auditor", suggesting that a site audit statement may exist for the site. It is also possible that a site audit statement was prepared subsequent to the remediation and validation reported in D&M 1999."*

JBS made the following statements relevant to the site:

- Confirmed the site to be a vacant block of land and predominantly vegetated.
- An area of raised topography was located along the northern boundary of the site and was possibly material that was removed as part of the development of St Charbel Boulevarde.
- Prior to 1999, several activities were identified as Areas of Environmental Concern (AEC) based on the site history. The conclusions in the extract from the D&M 1999 reported that *"… from a contamination perspective the site was suitable for residential use with gardens and accessible soils. However, while the works described in the report appear to have been appropriate to remediate the contamination described in the report, in the absence of analytical data and figures: to support the statement, JBS is unable to comment on that conclusion."*
- The site appeared to have remained relatively unchanged since the D&M report in 1999 that concluded the land was suitable for residential uses.

2.4 Environmental Setting

2.4.1 Topography and Drainage

The site is situated at an approximate elevation of 40 to 50m AHD (Australian Height Datum). Various locations subject to stockpiling could be artificially elevated above these levels; however, this was not confirmed. Onsite topography reveals a natural high point from the central area of the site with a gentle slope down to the east and west from that high point.

There is an unnamed creek that borders the east of the site. Runoff from the site is partially blocked by the formation of Stockpile A on the east site boundary. The creek appears to drain north, eventually joining with other small tributaries of Werrington Creek then onto South Creek further north northeast in the suburb of St Marys.

2.4.2 Geology and Soils

Review of the 1:100,000 Geological Series Map for the Penrith area[3] shows that the site is situated on Triassic period Bringelly Shales from the Wianamatta Group. Bringelly Shales consist of shale, carbonaceous claystone, laminite, fine to medium-grained lithic sandstone, rare coal and tuff.

[3] Penrith 1:100,000 Geological Series Map - Sheet 9030 NSW Department of Minerals and Energy, Edition 1 1991

The soil landscape map[4] shows that the underlying soils at the site are of the Luddenham soil landscape and has the following traits:

- Luddenham Soils: shallow (<100 cm) dark Podzolic Soils or massive Earthy Clays on crests; moderately deep (70–150 cm) Red Podzolic Soils on upper slopes; moderately deep (<150 cm) Yellow Podzolic Soils and Prairie Soils on lower slopes and drainage lines.

2.4.3 Hydrogeology

The site is situated in the Upper South Creek hydrogeological landscape for the Western Sydney Area[5]. Based on the site location and catchment area of Werrington Creek, it is assumed that local groundwater flows in a predominately northerly direction towards South Creek. The Phase 1 (JBS 2012) stated groundwater was reported in the D&M report (D&M 1999) at between 2.9m and 7.9m below ground surface.

The Phase 1 (JBS 2012) included a review of registered groundwater bore information and found there were four (4) registered groundwater bores located within 500m to the north of the site. Information was available for only three of the four registered bores (referred to as GW019680, GW020547 and GW020069). The three bores were drilled to depths of 53m, 75m and 91m below ground surface (bgs), however there was no information regarding the groundwater bearing zone or standing water levels. Two of the registered bores (GW020069 and GW020547) were registered for waste disposal and one bore (GW019680) was registered as a test bore.

Our review of the registered groundwater bore database (WaterNSW) confirmed the three groundwater bores to the north of the site. There were no other additional registered bores identified within 500m of the site in any direction.

2.5 General Housekeeping Activities

During the latter part of 2020 and into 2021, the site owner undertook an array of housekeeping activities as a general tidy-up of the site and to improve the visual appearance of the site. This work included partial disestablishment of the works compound area, removing some trash and garbage from areas of the site, removing empty tins and other various containers stored in the compound area, as well as demobilisation of some heavy machinery and equipment (e.g. some of the large excavators and dump trucks parked onsite).

As part of general housekeeping duties, Sullivan-ES identified a few localised areas that should be addressed as part of the effort to improve the visual appearance of the site. A couple of small soil and rubble piles that appeared inconsistent with all other natural soils stockpiled onsite were earmarked for removal. These materials were dealt with by sampling for waste classification requirements (represented by samples identified as Stockpile TP40, Stockpile TP42 and Stockpile TP50 and excluded from the dataset of this Assessment); followed by a transport and disposal offsite to a licenced facility in accordance with the Waste Guidelines (2014) and the POEO (Waste) Regs 2014. Records of classification and disposal of material related to general housekeeping duties can be provided upon request.

[4] www.environment.nsw.gov.au/eSpade2WebApp.
[5] www.environment.nsw.gov.au/eSpade2WebApp.

Once general housekeeping activities were completed, supplementary sampling was conducted to verify any residues from those materials had not impacted underlying localised soils. Chemical results of those samples are included in this Contamination Assessment, refer to Table 1 (**Appendix B**) as samples identified as SS15, SS16 and SS17.

2.6 Integrity Evaluation of Information

Information was collected from a number of sources for the purposes of this Contamination Assessment. Government information sources are considered accurate and without bias. Information sourced from JBS 2012 provides a reasonably clear indication of the historical land use which is sufficient for the purposes of this assessment. Sullivan-ES therefore consider the background information to be of an acceptable standard for evaluating contamination risk in accordance with the requirements under SEPP 55 and the SEPP 55 Guidelines.

3 Assessment Methodology

3.1 Data Quality Objectives

The Data Quality Objectives (DQOs) for the assessment are based on guidance presented in the ASC NEPM 2013 – Schedule B2. The DQOs establish a framework for contamination investigations, which incorporates a seven-step process that defines the problem at the site being investigated and then optimises the design of the investigation.

Step 1 - State the Problem

Pre-lodgement advice from Council (Ref: PL20/0044) stated:

> *"The site has been used as a transport and/or works compound, and has been subject to significant filling, in recent years. Both uses are potentially contaminated activities.*
>
> *As such, a contamination investigation of the site must be submitted with any application to demonstrate that the site is suitable, or can be made suitable, for the proposed use as per clause 7 of SEPP55. The investigation is to be undertaken by a suitably qualified and experienced consultant in accordance with relevant NSW EPA guidelines and NEPM 2013."*

The problem under investigation was:

- Presence of unknown contamination associated with recent activities onsite as identified by Council and limited to:
    I. Works compound area
    II. Soil stockpiling areas

Preliminary Conceptual Site Model

A preliminary Conceptual Site Model (CSM) was developed in consideration of potential historical/recent site activities and existing site condition. The preliminary CSM takes into account the future use of the land as residential land.

1. Contamination Sources and CoPCs
    a. historical construction-related activities in the works compound - heavy metals, hydrocarbon compounds (petroleum and polycyclic aromatics), pesticides, asbestos.
    b. potential imported fill and soil stockpiling – heavy metals, hydrocarbon compounds (petroleum and polycyclic aromatics), pesticides, PCBs and asbestos.
2. Receptors
    a. Human – onsite construction workers, onsite future residents, offsite residents.
    b. Ecological – onsite terrestrial and offsite aquatic ecosystems, groundwater.
3. Exposure Pathways
    a. Onsite – direct ingest/contact/inhalation (short and long term).
    b. Offsite - ingest/contact/inhalation (short and long term), aquatic contact (long term)

Step 2 - Identify the Decision

The principal study question(s) that arises from Step 1, if contamination is identified, are:

- Are or will human and environmental receptors be exposed to identified contamination onsite and is the risk posed by contamination unacceptable requiring intervention?
- Is the site suitable, in the context of land contamination, for the proposed residential land use scenario?

Step 3 - Identify Inputs to the Decision

Primary inputs to making a decision are:

- Available and reliable environmental data obtained from historical reports.
- New data and observations made during field works.
- Results of chemical analyses of samples collected.
- Statistical data of new and existing data sets.
- Assessment of the suitability of new data for the purposes of environmental assessment through application of data quality indicators (DQIs).
- Assessment of the data in the context of the adopted investigation criteria.
- Characterisation of risk.

Step 4 - Define the Study Boundaries

Study boundaries for this assessment are laterally defined by the lot boundary of the site, as shown on Figure 2 and Figure 3 and vertically defined by collection of new soil data from soil stockpiles and natural soil surfaces. Groundwater was not assessed at this stage of the site investigation.

Temporal boundaries are defined within the limitations of this report.

Step 5 - Develop a Decision Rule

The decision rule for this assessment will be:

- If the concentration of any analysed contaminant in collected samples exceed adopted investigation criteria for the land use; then characterise and assess risk to relevant receptors.
- If the risk posed by contaminants in shown to be unacceptable for the land use, then make recommendations to ameliorate contaminants such that the risk is eliminated or is made acceptable and the site made suitable.

A decision on the acceptance of analytical data will be made on the basis of the Data Quality Indicators (DQI) that are compliant with PARCC parameters (Precision, Accuracy, Representativeness, Completeness and Comparability). The quantitative and qualitative measures/criteria employed to enable application of these parameters are described as follows.

Field-Based Activities

Precision: A quantitative measure of the variability (or reproducibility) of data. Field duplicates were collected at a rate of one duplicate per 10 primary samples collected (i.e. 10% or an equivalent of 5% each). The relative percent difference (RPD) of the detected concentrations in the parent and duplicate was calculated with the following acceptable limits.

- No RPD limit <10 times LOR.
- 50% RPD limit 10-20 times LOR.
- 30% RPD limit >20 times LOR.

Accuracy: A quantitative measure of the closeness of reported data to the "true" value, applying the following acceptable limits.

- Rinsate and/or field blanks <LOR.
- Trip Spike vs Trip Spike Control recoveries between 70-130%

Representativeness: The confidence (expressed qualitatively) that data are representative of each media present on site, with the following conditions met.

- Appropriate sampling methods adopted, and media sampled, and chemicals analysed (Step 7).

Completeness: A measure of the amount of useable data from a data collection activity, with the following conditions met.

- Appropriate Standard Operating Procedures (SOPs), and experienced staff (> 2yrs experienced), and documentation collected (logs, COC, instrument calibration, water monitoring readings). Refer Step 7.

Comparability: The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event, with the following conditions met.

- Appropriate Standard Operating Procedures (SOPs), and experienced staff (> 2yrs experienced). Refer Step 7.
- Appropriate sample handling and preservation, and field conditions (Step 7).

Analytical Laboratory-Based Activities

Analytical laboratories operating under a NATA accreditation were assessed based on their internal and accreditation performance. As standard, a suitable internal QA/QC program is employed to include analysis of method blanks, matrix spikes, surrogate spikes, laboratory control samples and laboratory duplicates. The laboratory will report on whether the QA/QC analysis meets the laboratory's adopted internal data quality objectives.

Step 6 - Specify Limits on Decision Errors

Specific limits for this project are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and industry standard procedures for field sampling and handling.

This step also examines the certainty of conclusive statements based on the available new site data collected. This should include the following points to quantify tolerable limits:

- A decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative.

In order for decision rules to be sound, they were designed to minimise decision errors. The risk of decision error was mitigated by:

- Ensuring fieldwork tasks were undertaken by suitably experienced field staff and sub-contractors, with reference to the DQOs presented in this report;
- Ensuring laboratory analyses were undertaken by NATA accredited laboratories; and
- Ensuring interpretation of data was undertaken by suitably experienced environmental consultants and/or outsourcing interpretation to technical experts (if warranted).

Step 7 - Optimise the Design

The sampling program designed for this investigation as described in Section 3.2 was aimed at obtaining the necessary data to make the decision identified in Step 2.

3.2 Basis to Sampling

The sampling approach was based on the premise of collecting critical soil quality information on a systematic and judgemental sampling pattern with a higher degree of frequency and certainty in the achieved data set.

In accordance with ASC NEPM (2013), the stockpiles were assessed adopting a 3-dimensional systematic sampling approach using an excavator. This approach is best suited for stockpiles to expose a larger surface area both vertically and horizontally to visually assess the stockpile profile, potential contamination, soil features and soil heterogeneity..

The sampling density within soil stockpiles and across natural ground surfaces was considered sufficient to characterise all soils across the site (either stockpiled, laid or natural ground) in a manner to meet the required objectives.

It should be noted that in accordance with the NSW EPA Sampling Design Guidelines 1995, it is recommended to collect samples from a minimum 55 individual locations for a land size of approximately 5.0 hectares. We have exceeded this recommended number by sampling/inspecting 75 individual locations and chemically analysing samples from 62 of those locations (including 3 composite samples).

All soils sampling locations are presented on Figure 3 (**Appendix A**).

3.3 Field Sampling Program

Details of the field sampling program are presented below.

Table 3-1 Field Sampling Summary

Activity/Item	Details
Date of Field Activities	Part 1 – 30 Nov and 1 Dec 2020 – Site inspection and soil sampling. Part 2 – 20 and 22 April 2021 – Soil sampling.
Soil Logging and Inspection of Material	Exposed soil materials during test pit and auger sampling were thoroughly inspected for the presence of potential ACM. Soil classifications and descriptions are based on Australian Standard AS1726-1993 Geotechnical Site Investigations.

Assessment Methodology

Activity/Item	Details
	Soil descriptions for the lithology encountered during sampling are presented in soil logs (**Appendix C)**.
Soil Sampling and Density	Soil samples were taken directly from the excavator bucket (1.0m wide) or from the hand auger (75mm wide) using single use disposable nitrile gloves. Stockpile density: a total of 22 locations representing the two large stockpiles identified as Stockpile A and Stockpile B was sufficient for characterising these materials as described in the ASC NEPM (2013) and VIC EPA (2010)[6] for assessing stockpiles greater than 200m^3 by calculating the 95%UCL averages. Sampling Density: 75 locations across a site area of approximately 5.0 hectares which included both stockpile and natural ground surface sampling. Frequency of chemical analysis is presented in Table 3.2.
Decontamination Procedures	Sampling tools were decontaminated between sampling locations with potable water and a solution of Decon 90. Single use disposable nitrile gloves were worn at all times and changed between each soil sample.
Sample Preservation	Samples were placed in laboratory-supplied jars containing appropriate preservatives or suitable asbestos sampling bags. Samples were stored on ice in a cooler while on-site and in transit to the laboratory.
Disposal of Soil Cuttings and Materials	Soil cuttings/spoil was used to backfill test pits and soil bores once samples had been collected. Single use materials used during sampling were placed into garbage bags and disposed off-site.

3.3.1 Sample Analyses

Samples were analysed in accordance with the table below.

Table 3-2 Sample Analysis Schedule

	TRH/TPH	BTEXN	PAHs	Metals	Asbestos ID	Physical Properties	OCP/OPP	PCBs
Primary soil samples	55	55	55	58	8	1	41	36
QA/QC – Intra-lab field duplicates	6	6	6	6	0	0	5	5
Trip spike and trip blank	3	3	0	0	0	0	0	0

[6] EPA Victoria 2010, Industrial Waste Resource Guidelines (7), Sampling and Analysis: Soil Sampling, Environment Protection Authority.

	TRH/TPH	BTEXN	PAHs	Metals	Asbestos ID	Physical Properties	OCP/OPP	PCBs
Total all samples	**64**	**64**	**62**	**64**	**8**	**1**	**46**	**41**

Table notes: Total Petroleum/Recoverable Hydrocarbons (TPH/TRH), Benzene, Toluene, Ethylbenzene, Total Xylenes and Naphthalene (BTEXN), Polycyclic Aromatic Hydrocarbons (PAHs), Metals (As, Cd, Cr (total), Cu, Hg, Ni, Pb, Zn), Organochlorine Pesticides (OCPs), Organophosphorus pesticides (OPPs), Polychlorinated Biphenyls (PCBs).

3.4 Quality Assurance and Quality Control

Quality Assurance and Quality Control (QA/QC) was governed on the basis of the Data Quality Indicators (DQI) using PARCC parameters as listed in the DQOs (Step 5) and reproduced as follows:

- Precision: A quantitative measure of the variability (or reproducibility) of data.
- Accuracy: A quantitative measure of the closeness of reported data to the “true” value.
- Representativeness: The confidence (expressed qualitatively) that data are representative of each media present on site.
- Completeness: A measure of the amount of useable data from a data collection activity.
- Comparability: The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.

The Assessment was completed following standard operating procedures for conducting site contamination investigations. Standards followed included:

- General field documentation
- Health and safety
- Use of Personal Protective Equipment (PPE)
- Representative sample collection and labelling
- Equipment calibration
- Chain of Custody documentation for analytical samples
- Decontamination
- Collection of quality control samples (that may include: intra laboratory, inter laboratory, rinsates, blanks, spikes).

The data validation adopted for this assessment was based on the following guidance documents:

- Schedule B2 of the National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM 2013).
- Australian Standard 4482.1 Guide to the investigation and sampling of sites with potentially contaminated soil, Part 1: Non-volatile and semi-volatile compounds, 2005.
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (EPA 540-R-10-011, dated January 2010).
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (EPA 540/R-99/008, dated June 2008).

Assessment Methodology

The data validation process involves the checking of analytical procedure compliance and the assessment of the accuracy and precision of analytical data from a range of quality control measurements generated from both field sampling and analytical programs. Specific elements that have been checked and assessed for this project include:

- preservation and storage of samples upon collection and during transport to the laboratory
- holding times
- use of appropriate analytical procedures
- required LOR
- frequency of conducting quality control measurements
- laboratory blanks
- field duplicates
- laboratory duplicates
- matrix spike/matrix spike duplicates (MS/MSDs)
- surrogates (or System Monitoring Compounds)
- the occurrence of apparently unusual or anomalous results.

4

Soil Assessment Criteria

The site is proposed for residential land with single lot dwellings and accessible gardens and lawned areas. The adopted assessment criteria reflects the sensitive nature of human and environmental receptors as occupants and inhabitants of the residential land.

The following criteria were adopted from ASC NEPM 2013 for assessing soils on the site as listed in Table 1 (**Appendix B**):

- HIL A and HSL A - Residential with garden/accessible soil also including childcare centres, preschools and primary schools.
- EIL/ESL – Urban residential/public open space.
- Management Limits – Residential, park land and public open space.
- Asbestos HSLs – Residential A.
- Soil Aesthetics.

4.1 Notes on Adopted Criteria

Health-based Investigation Levels (HILs)

The National Environment Protection (Assessment of Site Contamination) Measure 2013 (ASC NEPM 2013) Health-based Investigation Levels (HILs) (Schedule B1) provides a framework that is applicable for assessing human health risk via all relevant pathways of exposure and covers a broad range of metals and organic substances. Different levels are provided for a variety of exposure settings based on the land use scenario at a particular site.

Health Screening Levels (HSLs)

The ASC NEPM 2013 HILs do not provide criteria for petroleum hydrocarbon chemicals, therefore the Health Screening Levels (HSLs) were developed and form part of the ASC NEPM 2013 in Schedule B1. The ASC NEPM 2013 – HSLs are designed to be protective of human health and are applicable to assessing human health risk via the inhalation pathway. The HSLs used in this report have not been adjusted for site specific parameters such as moisture content for this phase of work. HSLs are available for various depth profiles and predominant lithology (sand, silt and clay).

HSLs relevant to the top 1.0m of soil with a clay consistency were adopted.

HSLs for direct contact were adopted from Table 4 of CRC CARE Technical Report No. 10 by Friebel and Nadebaum (2011).

Ecological Investigation/Screening Levels

The ASC NEPM 2013 Ecological Investigation levels and Ecological Screening Levels (EILs and ESLs) have been developed for selected metals and organic substances and are applicable for assessing risk to terrestrial ecosystems. EILs depend on specific soil physicochemical properties, whereas ESLs do not, and both are relevant to land use scenarios and apply to the top two metres of soil. EILs take into account soil texture and age of the impacts, whereas ESLs account only for soil texture.

Specific EILs were calculated using the ASC NEPM EIL Calculation Spreadsheet using site specific physical parameters collected in the field (identified as natural soils at location SS07A) to calculate EILs for aged contamination sources. The site-specific parameters from laboratory testing were as follows:

- CEC (16.4cmol(+)/kg).
- pH (4.0) – CaCl method.
- iron 2.1%
- OC (<0.5%).
- Clay (56%).
- Low traffic volumes.
- Determination of selected metals Average Background Concentrations (ABC) from onsite natural soils

Asbestos Health Screening Levels

The ASC NEPM 2013 asbestos HSLs have been developed for managing land use impacts associated with asbestos and are applicable for assessing risk to human health. The guideline has been derived from the Western Australian Department of Health (WA DoH 2009) guidance. The guidance covers bonded Asbestos Containing Material (bonded ACM), Fibrous Asbestos (FA) and Asbestos Fines (AF).

Note that the quantitative criteria (i.e. percentage of asbestos materials) were not used in this assessment given that the analysis was to determine the presence of asbestos only and not to quantify asbestos materials in soils. Visual identification and subsequent laboratory analysis were used to assess for potential asbestos containing materials (ACMs) such as fibro sheeting. The ASC NEPM 2013 Asbestos HSLs include a qualitative approach such that no visible asbestos should be at the soil surface for all forms of asbestos. This qualitative approach was also adopted for this investigation.

Management Limits

The ASC NEPM 2013 Management Limits in Schedule B1 are relevant for TRH contaminants only. The Management Limits are specific for soil types (coarse and fine) and land uses. If adopted on a site, Management Limits are intended to avoid or minimise the potential effects of the following and require consideration of site-specific factors to determine the maximum depth to which the limits should apply:

- Formation of observable light non-aqueous phase liquids (LNAPL).
- Fire and explosive hazards.
- Effects on buried infrastructure e.g. penetration of, or damage to, in-ground services by hydrocarbons.

Aesthetic Considerations

In accordance with the ASC NEPM 2013 in Schedule B1 the aesthetic state of sites is required to be taken into account. Aesthetic issues generally relate to the presence of materials with a negligible risk or non-hazardous inert foreign material in soil or fill resulting from human activity. Sites that have been assessed as being acceptable from a human health and environmental perspective may still contain such foreign anthropogenic material. An assessment of the site aesthetics requires consideration of the natural state of soil on any given site, and a comparison between it and the soil encountered during investigations.

In particular, soils on site should not exhibit discolouration (staining), a malodorous nature (odours), abnormal consistency (rubble and trash) or show visible evidence of industrial wastes.

5 Results and Discussion

5.1 Field Observations

The following observations were made while conducting the Assessment:

- The test pitting sampling show the stockpiled soils were generally consistent with naturally occurring materials, as described in the soil logs (**Appendix C**).
- The test pitting across the stockpiles as a whole met the frequencies described in ASC NEPM (2013) for assessing stockpiles greater than 200m^3 and adopting the method for calculating the 95%UCL averages.
- Minor amounts of foreign matter were observed in some stockpiles including the large stockpiles identified as Stockpile A and Stockpile B. Such materials included concrete, brick and bitumen pieces, clay pipe, timber offcuts, scrap metal, and hard and soft plastics (of various nature).
- We estimate that the total amount of foreign matter in Stockpile A and Stockpile B would be no greater than a rough estimate of 0.5% of total quantity of soil. Foreign matter in all other smaller stockpiles is expected to be similar or of a lesser amount.
- The foreign matter observed in stockpiles is inert in nature and pose no potential chemical impact to the soils.
- Some stockpiles included crushed rock and boulders consistent of natural materials.
- Stockpile A covers a large area along the eastern site boundary with an approximate height of up to 5-6m at some locations.
- Stockpile B covers a large area of the eastern side of the site with a height of no more than 3.0m.
- All other soil stockpiles were of a small footprint ranging from heights of no greater than 1.0m to 2.0m.
- Large areas of the site are consistent with virgin natural ground comprising red brown high clay content soils underlain by highly weathered shaley rock.
- No suspected asbestos containing materials (ACM) were observed on the ground surfaces on site or within observed stockpiled material.
- No site areas showed vegetation stress or dieback.

5.2 Soil Results

Soil analytical results are presented in Table 1 and Table 2 (**Appendix B**) and in laboratory reports provided in **Appendix G**.

The results show that the majority of all soil samples were either below the laboratory detection level (i.e. not detectable) or well below the adopted soil investigation levels for protecting human and environmental health.

The stockpile results from TP18-TP29 and TP32-39 demonstrate a consistency with soils collected from the natural virgin ground and are considered to be stockpiled natural soils. All stockpile results and calculated 95% UCLs, in accordance with ASC NEPM 2013, were below the investigation criteria.

There were three samples that reported Copper at or marginally above the site specific calculated EIL (45mg/kg) and one sample that reported Zinc above the site specific calculated EIL (130mg/kg). One of the Copper results (SS03) was a natural soil sample indicating that Copper levels exhibit moderate variability and could be naturally elevated in the native soils. We consider these results as inherent variability of the natural soils data set and do not constitute a health risk to ecological receptors given the very low ecological screening values calculated for Copper and Zinc.

Three samples reported BaP concentrations at or marginally exceeding the adopted ESL (0.7mg/kg). The presence of bitumen pieces in the soil samples at the detected locations is considered to be the BaP source. The adopted ESL is a low reliability value (as stated in ASC NEPM 2013) and should only be used as a preliminary screening value. Given that bitumen is considered the source of BaP and the screening value is low reliability, we do not consider that the presence of BaP in these samples is a cause for concern to ecological receptors that warrants any further assessment.

No asbestos materials or fibres were detected in any soil samples analysed.

5.3 Revised Conceptual Site Model

A revised CSM has been developed in consideration of the current results and field observations. The CSM takes into account the future use of the proposed residential land.

Contamination Sources and Contaminants of Concern

No onsite contamination sources were identified as a result of current or historical site activities.

Source-Pathway-Receptor Linkages

No contamination sources were identified during the investigation therefore there is no complete source-pathway-receptor linkages with future/current human or ecological users of the site.

Groundwater on the site is not considered to be at risk given the non detectable concentrations of most organic chemicals (other than very low concentrations of PAHs at three locations) and very low concentrations of inorganic metals in soils that would resemble naturally occurring conditions.

6 Quality of Analytical Data

Analytical data validation is the process of assessing whether the data is in compliance with method requirements and project specifications. The primary objective of this process is to ensure that data of known quality are reported, and to identify if data can be used to fulfil the overall project objectives.

On the basis of the analytical data validation procedure employed, the overall quality of the analytical data produced is considered to be of an acceptable standard for interpretive use. The table below provides a summary of the data validation.

Table 6-1 Data Quality

Requirement	Compliance	Comments
Field Duplicates	Yes	Intra-laboratory duplicate samples were collected by splitting a sample into the primary and duplicate sample containers. Six (6) intra-laboratory duplicates were collected for 58 primary samples resulting in greater than 1 duplicate per 10 primary samples analysed (i.e. >10%) in accordance with AS4482.1: 2005. No inter-laboratory duplicate samples were collected for this project.
RPDs	Yes	All calculated RPDs fall within the acceptable limits of <30% to <50%, refer to Table 1 and Table 3 (**Appendix B**). Where concentrations of either sample was <LOR or <10 times the LOR, then no RPD was calculated. This evaluation is in accordance with section 8 of AS4482.1: 2005.
Rinsate Blanks	N/A	No rinsate blanks were used for the detailed site contamination assessment as predominately no reusable sampling equipment was used.
Trip Blanks/Spikes	N/A	Both trip blank and trip spike samples for soil were utilised for the project to assess potential losses of volatile contaminants. Refer Table1 & 3. Results showed no detections of volatile chemicals in the trip blank. Trip spike recovery was between 70-130%. The Trip spike and Trip Spike Control (TSC) reported sufficient recovery of volatile constituents to conclude losses (if any) were negligible.
Sampling equipment properly decontaminated	Yes	Reusable sampling equipment and tools were decontaminated between sampling locations with a solution of Decon90 and rinsed with potable water. All other sampling equipment used were single use/disposable, (i.e. nitrile gloves)
Sample Preservation	Yes	Samples were properly preserved. Samples were compliant with required storage temperature. Refer laboratory SRN.

Quality of Analytical Data

Requirement	Compliance	Comments
Samples delivered to laboratory within sample holding times.	Yes	Confirmed from COCs and laboratory reports.
Equipment Calibration	N/A	No field instruments requiring calibration were used.
Analytical procedures	Yes	All analytical procedures were NATA accredited. All laboratory limits of recording were suitable for compared to the adopted investigation criteria. ***Soil Review – ES2043211 and ES2115170*** • *Quality Control Samples*: No method blank, duplicate, laboratory control or matrix spike outliers occurred. • *Analysis Holding Time*: Trip Spike 9 was analysed 1 day out of analysis time – Comparison of Trip Spike 9 recovery to TSC shows results were within acceptable limits and therefore this minor non-compliance is not considered to impact the quality of the data set. All other samples were analysed within holding time. • *Quality Control Sample Frequency*: No QCS frequency outliers occurred. With the exceptions noted above all remaining analyses meet compliance requirements.
SOPs and competent field personnel	Yes	Sampling procedures follow industry standards, and field staff (Adam Sullivan – more than 23 years' experience. Sean Guenther – 20 years' experience) are competent in sampling methods and QA/QC protocols.

7

Conclusions

The following conclusions are made based on the findings of this Detailed Site Contamination Assessment; subject to the limitations presented in Section 9:

- The site is defined as Lot 125 & Lot 126 in DP1215199 at 741-755 Great Western Highway, Werrington NSW with an area of 4.898 hectares.
- It is proposed to subdivide the land for residential allotments with accessible gardens and soil. The site is identified as Stage 4 of the larger Settlers Estate Residential subdivision development.
- At present the site is generally vacant and unused. In the recent past the site was used as a works compound for earthworks and construction activities for the adjoining Settlers Estate development including Stages 1, 2 and 3. The site also contains stockpiles of soil originating from the adjoining development lands. These adjoining lands are also owned by the site owner (Statewide Planning).
- Historically the site was used for Defence activities as part of a larger property until 1999 when the Defence property was remediated and validated as suitable for residential uses with accessible soils. The site remained unused since 1999 and ownership was transferred in 2005.
  Recent site activities identified by Council as posing a potential contamination risk were considered to be limited to the entrance area of the site as a works compound and stockpiling of soil at various locations across the site. These activities and areas of the site formed the basis to the assessment.
- Sampling and analysis of soil samples collected from the works compound, from stockpiled soils and natural soil layers show concentrations of contaminants meeting the adopted investigation levels for land to be used for residential dwellings.
- The stockpiles visually and chemically are consistent with the natural virgin ground and are considered to be stockpiled natural soils. All stockpile results and calculated 95% UCLs are below the investigation criteria.
- Onsite soils, either stockpiled or at ground level, are unlikely to pose an unacceptable health risk to human or ecological receptors under a low-density residential land use setting.
- No actual or suspected Asbestos Containing Materials (ACMs) were observed during site works or analytically detected at the surface or in subsurface soils sampled onsite.
- The presence of minor amounts (i.e. visually estimated at <0.5%) of inert foreign matter in the soil stockpiles does not cause a contamination concern. The soils are considered suitable to be beneficially used on the residential development site.
- We consider that the adopted test-pitting and sampling approach has adequately characterised the stockpiles visually and chemically as natural materials; however, we recommend prior to reuse of the stockpiled soils, the stockpiles are suitably screened to remove foreign matter, for aesthetic considerations, to improve the visual appearance of the soils.

Based on the findings of the Detailed Site Contamination Assessment, recent activities on parts of the site used as a works compound and soil stockpiling areas have not caused contamination of the land and the site is considered suitable for the proposed subdivision development as residential land.

Limitations

Sullivan Environmental Sciences Pty Ltd, (Sullivan-ES) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of Statewide Planning Pty Ltd, and only those third parties who have been authorised in writing by Sullivan-ES to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

Where this Report indicates that information has been provided to Sullivan-ES by third parties, Sullivan-ES has made no independent verification of this information except as expressly stated in the Report. Sullivan-ES assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 30 Nov 2020 and 11 May 2021 and is based on the conditions encountered and information reviewed at the time of preparation. Sullivan-ES disclaims responsibility for any changes that may have occurred after this time.

Investigations undertaken in respect of this Report are constrained by the particular site conditions, such as the location of buildings, services and vegetation. As a result, not all relevant site features and contamination may have been identified in this Report.

Subsurface conditions can vary across a particular site and cannot be exhaustively defined by the investigations described in this Report.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by Sullivan-ES.

To the extent permitted by law, Sullivan-ES expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. Sullivan-ES does not admit that any action, liability or claim may exist or be available to any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Notes
Where a result is <LOR, half the detection limit has been used to calcuate 95%UCLs with ProUCL
#1 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs
#2 Total PAHs: Based on sum of 16 most common reported
#3 PCBs: HIL refers to non-dioxin like PCBs only.
#4 HIL does not address elemental mercury.
#5 Arsenic: HIL assumes 70% oral bioavailability.
#6 Lead: HILs A,B,C based on blood lead models
#7 Derived soil HSL exceeds soil saturation concentraiton
#8 F2 = subtract napthalene from the >C10 - C16 fraction.
#9 F1 = subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#10 Aged values apply to arsenic contamination present in soil > 2 years.
#11 ERRATA Updated 30 April 2014 . Naphthalene should not be subtracted.
#12 Errata 30 April 2014. Naphthalene should not be subtracted from >C10-C16.
#13 Separate management limits for BTEX &
#14 Site specific EILs derived based on: Low traffic
* Criteria for total Aldrin and Dieldrin combined
# Criteria for total DDT, DDE and DDD combined
^ Criteria for total endosulfan combined
** Criteria for total chlordane combined

Suggested UCL to Use

95% Student's-t UCL 9.96

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Adjusted Gamma UCL 21.48

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

DRILLING METHOD Excavator

TRENCH SIZE 2.5m deep x 1.0m wide
TOTAL DEPTH 2.5m
LOGGED BY A.S.
CHECKED BY S.G.

COMMENTS Stockpile is approximately 8m high. Represented by testpits TP18 - TP29. Test pit 23 onwards conducted on 1/12/2020

Depth (m)	PID	Relevant Testpit Samples	Is Analysed?	Graphic Log	USCS	General Material Description	Testpit Foreign Materials Observations
0						FILL: Silty Clay, medium plasticity - 0.0-0.5m	Anthroprogenic items observed include TP18 - Nil TP19 - Nil TP20 - Some sandstone and concrete with other crushed rubble (bricks) TP21 - bitumen and soft plastic TP22 - metal pipe and some bitumen TP23 - broken pavers and styrofoam material TP24 - no ballast, clay pipe, green hessian material and soft plastic TP25 - agg pipe, brick, metal and concrete chunks TP26 - green hessian material and agg pipe length TP27 - bricks, green hessian, cloths and rusted wire TP28 - Nil TP29 - Only 1 piece of clay pipe observed
0.5		TP20_0.5 (QC03) TP21_0.5				FILL various Clay mixtures 0.5-1.4m TP18 - TP21 Silty Clay Fill, medium plasticity, brown with some gravels, dry and stiff. TP22 - TP29 Sandy Clay fill, relatively wet, tan brown, high plasticity, soft to firm Some to minor foreign materials observed in stockpile testpits throughout profile	
1		TP18_1.0 TP19_1.0 TP23_1.0					
1.5		TP28_1.5 TP29_1.5				FILL: various Clay mixtures 1.4-2.5m TP18 - TP21 Silty Clay Fill, medium plasticity, generally brown with no odours and moist. A pocket of wet grey clay with anoxic odour observed in TP20 at 1.6m TP22 - TP29 Sandy Clay fill, moist to wet, tan brown to red brown, medium to high plasticity, soft to firm	
2		TP22_2.0 TP24_2.0 TP25_2.0 TP26_2.0 TP27_2.0					
2.5						End of Testpit at 2.5m at reach of excavator	

Disclaimer This log is intended for environmental not geotechnical purposes.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP066 : Positive PCB results are confirmed by re-extraction and re-analysis.
- EP080: The trip spike and its control have been analysed for volatile TPH and BTEXN only. The trip spike and control were prepared in the lab using reagent grade sand spiked with petrol. The spike was dispatched from the lab and the control retained.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

No. of samples received	: 38		
No. of samples analysed	: 38		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2043211**	Page	: 1 of 14
Amendment	: **2**		
Client	: **SULLIVAN ENVIRONMENTAL SCIENCES**	Laboratory	: Environmental Division Sydney
Contact	: ADAM SULLIVAN	Telephone	: +61 2 8784 8555
Project	: SES_585	Date Samples Received	: 04-Dec-2020
Site	: ----	Issue Date	: 07-May-2021
Sampler	: ADAM SULLIVAN	No. of samples received	: 60
Order number	: ----	No. of samples analysed	: 43

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Analysis Holding Time Compliance

Matrix: **SOIL**

Method / Container / Client Sample ID(s)		Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Days overdue	Date analysed	Due for analysis	Days overdue

Soil Glass Jar - Unpreserved							
TRIP SPIKE - 9,	TSC	----	----	----	09-Dec-2020	08-Dec-2020	**1**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Quote number	: EN/222		
No. of samples received	: 29		
No. of samples analysed	: 29		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Aleksandar Vujkovic	Laboratory Technician	Newcastle - Inorganics, Mayfield West, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Dian Dao	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP071: Results of sample SS10_0.0-0.2 have been confirmed by re-extraction and re-analysis.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCl - Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Order number	: ----	Date Analysis Commenced	: 27-Apr-2021
C-O-C number	: ----	Issue Date	: 04-May-2021
Sampler	: A. SULLIVAN		
Site	: ----		
Quote number	: EN/222		
No. of samples received	: 29		
No. of samples analysed	: 29		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Aleksandar Vujkovic	Laboratory Technician	Newcastle - Inorganics, Mayfield West, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Dian Dao	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2115170**	Page	: 1 of 13
Client	: **SULLIVAN ENVIRONMENTAL SCIENCES**	Laboratory	: Environmental Division Sydney
Contact	: ADAM SULLIVAN	Telephone	: +61 2 8784 8555
Project	: SES_585	Date Samples Received	: 23-Apr-2021
Site	: ----	Issue Date	: 04-May-2021
Sampler	: A. SULLIVAN	No. of samples received	: 29
Order number	: ----	No. of samples analysed	: 29

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP080S: TPH(V)/BTEX Surrogates	ES2115170-017	Z02	**Toluene-D8**	2037-26-5	73.4 %	73.9-132 %	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001	SOIL	In house: Referenced to Rayment and Lyons 4B3 (mod.) or 4B4 (mod.) 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM Schedule B(3).
pH (1:5)	EA002	SOIL	In house: Referenced to Rayment and Lyons 4A1 and APHA 4500H+. pH is determined on soil samples after a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
Electrical Conductivity (1:5)	EA010	SOIL	In house: Referenced to Rayment and Lyons 3A1 and APHA 2510. Conductivity is determined on soil samples using a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3
Soil Particle Density	EA152	SOIL	Soil Particle Density by AS 1289.3.5.1: Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Exchangeable Cations	ED007	SOIL	In house: Referenced to Rayment & Lyons Method 15A1. Cations are exchanged from the sample by contact with Ammonium Chloride. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Organic Matter	EP004	SOIL	In house: Referenced to AS1289.4.1.1. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001-PR	SOIL	In house: Referenced to Rayment and Lyons 4B1, 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM Schedule B(3).
Exchangeable Cations Preparation Method	ED007PR	SOIL	In house: Referenced to Rayment & Lyons method 15A1. A 1M NH4Cl extraction by end over end tumbling at a ratio of 1:20. There is no pretreatment for soluble salts. Extracts can be run by ICP for cations.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of reagent grade water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Organic Matter	EP004-PR	SOIL	In house: Referenced to AS1289.4.1.1. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
PAH/Phenols (SIM) : EP075(SIM)		
SS14_0.0-0.2	- HDPE Soil Jar	- Soil Glass Jar - Unpreserved
TRH - Semivolatile Fraction : EP071

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component
