Abbreviations

A list of common abbreviations used throughout this report is provided below.

As	Arsenic
AST	Aboveground Storage Tank
Cd	Cadmium
Cr	Chromium
Cu	Copper
BTEX	Benzene, Toluene, Ethylbenzene and Xylenes
B(a)P	Benzo (a) pyrene
EPA	NSW Environment Protection Authority
DO	Dissolved oxygen
DPE	NSW Department of Planning and Environment
DQO	Data Quality Objectives
DP	Deposited Plan
EC	Electrical conductivity
EH	Redox potential
EPA	New South Wales Environment Protection Authority
Hg	Mercury
HIL	Health Based Investigation Level
LOR	Limit of Reporting
MAH	Monocyclic Aromatic Hydrocarbon
Ni	Nickel
OCP	Organochlorine Pesticide
SAR	Site Audit Report
SAS	Site Audit Statement
PAH	Polycyclic Aromatic Hydrocarbons
Pb	Lead
PIL	(Provisional) Phytotoxicity Based Investigation Level
PCB	Polychlorinated Biphenyls
QA/QC	Quality Assurance/Quality Control
RPD	Relative Percentage Difference
TPH	Total Petroleum Hydrocarbons (C_6-C_9 and C_{10}-C_{36})
UST	Underground Storage Tank
Zn	Zinc

Executive Summary

JBS&G Australia Pty Ltd (JBS&G) was engaged by Legacy Property (Legacy, the client) to complete an Environmental Site Assessment (ESA) for properties located between Caddens Road and O'Connell Street, Caddens, NSW (the site). Currently the site (see **Figure 1**) is largely vacant and was previously used for rural residential purposes. The site is made up of a number of lots (see **Figure 2**) and these lots have been the subject of a series of environmental site assessments undertaken by the various land owners.

Legacy has consolidated the site under one ownership and it is understood is seeking a consolidated ESA to support an application to Penrith City Council for development of the land consistent with the current R1 – General Residential (Penrith LEP 2010) zoning.

The scope of the assessment included a site inspection, desktop review of available environmental site assessment reports, site history and background information to identify potential areas of environmental concern and associated contaminants of potential concern, the development and documentation of a conceptual site model based on the available information. In order to address a data gap identified in the review, intrusive sampling was undertaken on Lots 1, 2 and 6.

Based on the review of available information and investigations no contamination was identified which would preclude the residential development of the site. However, based on the scope of work completed for this assessment and subject to the limitations in **Section 8**, it is recommended that work, health, safety and environmental management controls (including protocols to manage unexpected finds) should be implemented during the development earthworks phase.

1. Introduction

1.1 Background

JBS&G Australia Pty Ltd (JBS&G) was engaged by Legacy Property (Legacy, the client) to complete an Environmental Site Assessment (ESA) for properties located between Caddens Road and O'Connell Street, Caddens, NSW (the site). Currently the site (see **Figure 1**) is largely vacant and was previously used for rural residential purposes. The site is made up of a number of lots (see **Figure 2** and **Section 2**) and these lots have been the subject of a series of environmental site assessments undertaken by the various land owners. Legacy has brought the site under one ownership and has commissioned the consolidated ESA to support an application to Penrith City Council for development of the land consistent with the current R1 – General Residential (Penrith LEP 2010) zoning[1].

This assessment has been conducted in accordance with guidelines made or approved by the NSW Environment Protection Authority (EPA) and relevant Australian Standards.

1.2 Objectives

The objective of the assessment is to assess the potential for contamination based on historical and current site activities and the environmental assessments undertaken to date. For the purpose of supporting a Development Application for the site, the ESA draws preliminary conclusions regarding the potential soil and groundwater issues which may affect the site's use for residential purposes.

1.3 Scope of Work

The following scope of works was undertaken:

- A site inspection and desktop review of available environmental site assessments, site history and background information to identify potential areas of environmental concern (AECs) and associated contaminants of potential concern (COPC);
- Development and documentation of a conceptual site model (CSM) based on the available information;
- Identification of potential data gaps based on the CSM;
- Undertaking intrusive investigations to address data gaps;
- Preparation of an ESA report in general accordance with relevant EPA Guidelines; and
- Assessment of whether the site is suitable, from a site contamination perspective, for the proposed land use.

2. Site Condition and Surrounding Environment

2.1 Site Identification and Previous Assessments

The site details are summarised in **Table 2.1**, and shown on **Figures 1** and **2**.

Table 2.1: Site Identifications

Identification		Description
Lot 11 DP522660		
Address	117 O'Connell Street, Caddens, NSW	Previously drive-in garden centre. Site buildings now demolished to ground level with some demolition stockpiles remaining. Asphalt, concrete, paving and gravel is also present. An irrigation dam is located in the southwest corner of the property.
Site Area	Approximately 2.6 hectares (ha)	
Current Land Use	Vacant land	
Former Land Use	Agriculture and later garden centre	
Lot 12 DP 522660		
Address	141 O'Connell Street, Caddens, NSW	Open sparsely vegetated paddock used for cattle grazing. Some hard rubbish (e.g. drums and baths) previously identified.
Site Area	Approximately 2.83 ha	
Current Land Use	Vacant land	
Former Land Use	Agriculture	
Lot 51 DP 1189505		
Address	143 O'Connell Street, Caddens, NSW	Agricultural land uses, including a dam which appears to be filled.
Site Area	Approximately 8 ha	
Current Land Use	Vacant land	
Former Land Use	Agriculture	
Lot 101 DP 564332		
Address	185 Caddens Road, Caddens, NSW	Open paddock with small pond/farm dam and fill in the north west corner and various.
Site Area	Approximately 3.41 ha	
Current Land Use	Vacant land, with limited sheep grazing.	
Former Land Use	Agriculture	
Lot 1 DP 515678		
Address	187 Caddens Road, Caddens, NSW	Rural residential, including remains of derelict brick building.
Site Area	Approximately 2.1 ha	
Current Land Use	Vacant land	
Former Land Use	Agriculture	
Lot 6 DP 502333		
Address	189 Caddens Road, Caddens, NSW	Road easement for access to rural residential property.
Site Area	Approximately 0.07 ha	
Current Land Use	Road access	
Former Land Use	Agriculture / orchards	
Lot 2 DP 502333		
Address	189 Caddens Road, Caddens, NSW	Rural residential with possible agricultural cultivation.
Site Area	Approximately 1.75 ha	
Current Land Use	Rural residential	
Former Land Use	Agriculture	
Lot 755 DP 1180111		
Address	207-213 Caddens Road, Caddens, NSW	Formerly comprised predominantly open farm land and orchard with occasional clusters of trees.
Site Area	Approximately 5.3 ha	
Current Land Use	Vacant land	
Former Land Use	Agriculture	

2.2 Surrounding Land-Use

The surrounding land uses have been identified as follows:

- North – Immediately bordered by O'Connell Street, and thence rural residential land which is part of the University Western Sydney campus;
- East – Western Sydney Records Centre in the north and rural residential land in the south;
- South – Immediately bordered by Caddens Road and thence rural residential land in the east and rural residential land in the west; and
- West – Immediately bordered by existing and developing residential areas in the south, and rural residential in the north.

2.3 Geology

Reference to the 1:100 000 Geology of the Penrith Sheet 9030 (1991) indicates the site is underlain by Bringelly Shale of mid Triassic age, the uppermost unit of the Wianamatta Group. The Bringelly Shale is composed of interbedded shale, carbonaceous claystone, laminate, fine to medium grained lithic sandstone and some coal and tuff. The site is located geologically towards the central part of the Penrith Basin where the Bringelly Shale is up to 90 metres thick and underlain by the Hawkesbury Sandstone[2].

The Soil Landscape Map of Penrith (Soil Landscape Series Sheet 9030, Scale 1:100,000, 1989), prepared by the Soil Conservation Service of NSW, indicates that the site is located within the Luddenham landscape area, with undulating to rolling low hills on Wianamatta Group shale, often associated with Minchinbury Sandstone and typically consists of localised impermeable, moderately reactive, highly plastic subsoil[3].

2.4 Topography

The site slopes from a high in the northwest and central area of the site towards the west, south and northeast. Site elevations are between 44 m Australian Height Datum (AHD) and 70 m AHD.

2.5 Hydrology

The site is predominantly surfaced with grass cover, whereby it is anticipated that surface water generated during periods of rainfall is likely to result in infiltration of the ground surface at a rate reflective of the clayey topsoil permeability. In periods of heavy or prolonged rainfall, excess water is expected to result in limited runoff collected by natural drainage channels that extend to the west towards Werrington Creek 80 m west of the site, and northeast and southeast of site that finally drain into Claremont Creek located approximately 750 m to the east of the site.

The two creeks drain into the Hawkesbury River, approximately 21 km north of the site.

2.6 Hydrogeology

Groundwater within the Bringelly Shale is located within a deep regional confined aquifer. Minor perched groundwater is also present within the weathered shale profile however these lenses are discontinuous and do not form an aquifer.

Registered groundwater bore information was obtained from the NSW Office of Water database on 20 September 2016[4] (Error! Reference source not found.). A review of the registered bore information indicated that there were no bores located within a 500 m radius of the site.

---

[3] Preliminary Contamination Assessment, Geotechnique Pty Ltd 28 June 2011 (12486/1-AA)

[4] NSW Government Office of Water (OW) (2016), accessed 20 September 2016, http://allwaterdata.water.nsw.gov.au/water.stm

Groundwater monitoring wells have been previously installed on Lot 12 (MW5), Lot 1 (MW6) and Lot 755 (MW4). Bore details are provided in Table 2.2 (PB 2009[5]).

Table 2.2: Site Bore Details

Bore	Geology intersected	Screened interval (m BGL)	Standing Water Level (m BTOC	Groundwater Elevation (m AHD)	Date groundwater level was recorded
MW4	Weathered sandstone	4.0-6.9	1.615	47.185	01/06/2009
MW5	Sandy clay/ weathered sandstone	8.0-11.0	8.325	59.225	01/06/2009
MW6	Sandy clay/ weathered sandstone/shale	5.0-8.0	8.240	53.045	01/06/2009

2.7 Acid Sulfate Soils

The site is reported to be within an area with 'no known occurrences of acid sulfate soil materials' (PB 2009), as such no further consideration of potential requirements for management of such conditions is required.

[5] Parsons Brinkerhoff (PB) (2009), *Phase 2 Environmental Site Assessment Caddens Release, Kingswood, NSW, 2747*, July 2009, Ref No. PR_9627 Rev B

3. Site History

3.1 Aerial Photographs

Aerial photographs from 1947, 1965, 1986, 2004 and 2014 were presented in MCE (2014). A summary of the findings from the review of these photographs, as well as the 2010 and 2016 aerial photographs (NearMap 2016[6]), is presented below.

Table 3.1: Aerial Photograph Observations

Year	Description	Surrounding Land Use
1947	The site appears to have been utilised for agricultural purposes, including orchards, grazing and possibly market gardens. A dwelling is noted at the centre of the site on Lot 1. A treed area is evident in the western area of Lot 755.	The site is surrounded by rural residential / agricultural properties including possible uses as market gardens and orchards. A house and large shed is located on the western boundary of Lot 11. The roads of O'Connell Street and Caddens Road are present.
1961	The site is under similar land use, with a treed area in the northeastern corner of Lot 12, and possibly a dwelling.	Similar to earlier aerial photography.
1978	A garden centre appears to be operating on predominately the northern half of Lot 11, a house and sheds have been constructed on Lot 2 and an orchard is present on the northwest corner of Lot 755.	The State archives development appears to be under construction east of Lot 51 and a house and cultivated fields are south of Lot 2.
1986	Similar to 1978, although the garden centre on Lot 11 now appears to operate over the whole lot, and the eastern area of Lot 2 appears to be under active cultivation.	The footprint of the State Archives development has been expanded, and the building west of Lot 11 has been enlarged.
1998	Similar to 1986, although the dwelling on Lot 1 appears to have been demolished.	The footprint of the State Archives has been further expanded. The cultivated fields south of Lot 2 has been replaced by orchard plantings on the western half.
2011	Similar to 1998, however, active cultivation on Lot 2 has reduced.	The footprint of the State Archives has been further expanded.
2014	There appears to be no orchards or cultivated fields within the site, and the area is likely to be used for grazing only. The garden centre on Lot 11 appears inactive.	Similar to 2011, however, the area west of Lots 2 and 6 has been or is the progress of being developed for residential uses.
2016	Similar to 2014.	Similar to 2014, residential development complete.

Copies of the aerial photographs are included as **Appendix B.**

3.2 EPA Records

A search of the NSW EPA's public register maintained under the *Protection of the Environment Operations Act 1997 (POEO Act)* was undertaken on 20 September 2016 for the subject site and surrounding properties. The results of the search are presented in **Appendix C**. The search identified that there were no current or former prevention, clean-up or prohibition notices for the site and immediate surrounds. Further the site or adjoining properties have not been notified to the NSW EPA under Section 60 of the *Contaminated Lands Management Act* (1997) as contaminated land.

In addition, the search of the EPA's public register for current and historical environmental protection license (EPL) records issued under the POEO Act has not identified any documents associated with the site or surrounding properties.

[6] Nearmap (2016), 5 May 2016 aerial photograph, accessed 7 July 2016, http://maps.au.nearmap.com/

3.3 Australian and NSW Heritage Register

A search of the Australian Heritage Trust database and the NSW Heritage Inventory was undertaken and records are included in **Appendix D**. The search did not identify the presence of any items of national or state significance in the vicinity of the site.

3.4 Council Information

The site is zoned as R1 (General Residential) under the Penrith City Council LEP 2010. Under the LEP, permissible uses (with consent) for land zoned as R1 includes (but is not limited to) attached dwellings, bed and breakfast accommodation, boarding houses, child care centres, community facilities, dwelling houses, emergency services facilities, exhibition homes / villages, flood mitigation works, group homes, home businesses, hostels, information and education facilities, multi dwelling housing, neighbourhood shops, places of public worship, recreation areas, roads, and semi-detached dwellings.

Penrith City Council Development Control Plan 2014 (DCP) for Caddens states that a 'Phase 2 Environmental Site Assessment' must be lodged with a Development Application (DA) on any land identified as 'potentially contaminated'. The Figure E1.20 – Potentially Contaminated Land in the DCP indicates the site is potentially contaminated with the exception of Lot 51 DP 1189505.

3.5 Integrity Assessment

The information obtained from formal published sources noted above has been found to be in general agreement with the known history of the site.

Based on the range of sources and the general consistency of the historical information, it is considered that the historical assessment has an acceptable level of accuracy with respect to the potentially contaminating activities that historically occurred on site.

4. Conceptual Site Model

4.1 Areas of Environmental Concern

Based on the site history review, areas of environmental concern and associated potential contaminants of concern have been identified at the site, as noted in **Table 4.1**.

Table 4.1: Areas of Environmental Concern and Associates Contaminants of Potential Concern

Areas of Environmental Concern (AEC)	Contaminants of Potential Concern (COPC)
Potential impacts associated with the storage of drums, use and leakage of machinery associated with historic agricultural activities	Metals, TPH, BTEX, PAHs, VOCs, pesticides
Application of pest control chemicals during site agricultural and maintenance activities	Pesticides
Hazardous building materials	Asbestos and lead
Landfilling with soil and wastes derived from site activities	Metals, TPH, BTEX, PAHs, VOCs, pesticides, asbestos

4.2 Potentially Contaminated Media

It is considered that there is the potential for the natural soils to be impacted as a result previous / current site activities including the storage / spillage of chemicals. Near surface natural materials around areas where historic structures were located have the potential to be impacted by asbestos and / or lead paint. This may have resulted from the deterioration of structures and / or the demolition of structures without appropriate controls to minimise the potential for contamination of surface soils with material debris. Furthermore, surface soils have the potential to have been impacted based on the historical use of the site for agricultural purposes.

The is also the potential for filling to have taken place to level areas in the footprints of the site features and in the construction of dams, and the fill to include wastes generated on the site (e.g. agricultural, garden nursery, ash on-site burning, and demolition waste).

Within dams there is the potential for contaminants to accumulate in water and sediment from surface water run-off.

Dependent upon the leachability of potential contaminants within surface soils, the migration of contaminants into the underlying subsurface soils and groundwater may occur.

4.3 Potential for Migration, Exposure Pathways and Receptors

Contaminants generally migrate away from a site via a combination of windblown dusts, rainwater infiltration, groundwater migration and surface water runoff. The potential for contaminants to migrate is a combination of:

- The nature of the contaminants (solid/liquid and mobility characteristics);
- The extent of the contaminants (isolated or widespread);
- The location of the contaminants (surface soils or at depth); and
- The site topography, geology, hydrology and hydrogeology.

The potential contaminants identified as part of the site history review are generally in either a solid form (e.g. metals, asbestos, etc) or liquid form (e.g. fuel, pesticides, etc).

The site is predominantly vegetated which significantly reduces the potential for windblown contaminants to migrate from the site.

The potential for contamination migration via infiltration of water and subsequent migration through the soil profile is possible as the site is predominantly unsealed. Migration of contaminants via surface water movement is possible in around the site exhibiting low lying areas proximate to the site boundaries.

Given the unsealed nature of the site, there is potential for migration of contamination to groundwater although this potential is mitigated dependent on depth to groundwater and permeability of overlying soils.

4.4 Potential Exposure Pathways

Based on the COPC identified in various media as discussed above, the exposure pathways for the site include:

- Dermal;
- Ingestion; and
- Inhalation.

Due to the potential presence of impacted soil on ground surfaces in areas of the site that may be accessed by future residents, potential exposures to be considered include dermal, inhalation and ingestion exposure pathways.

As groundwater is not anticipated to be extracted under the proposed land use, dermal contact and ingestion of groundwater is considered to be unlikely. However, dependent on the depth to groundwater and the extent of contamination in near surface soils, there is a potential for exposure to groundwater during future subsurface activities. Furthermore, dermal contact and ingestion of potentially impacted surface water are considered to be potential exposure pathways.

4.5 Receptors

Potential receptors of environmental impact present within the site which will be required to be addressed with respect to the suitability of the site for the proposed use include:

- Excavation / construction / maintenance workers conducting activities at the site, who may potentially be exposed to COPCs through direct contact with impacted soils and / or groundwater present within excavations and / or inhalation of dusts / fibres associated with impacted soils;
- Future occupants/users of the site may potentially be exposed to COPCs through direct contact with impacted soils and / or ingestion of impacted soils and / or inhalation of dusts / fibres associated with impacted soils; and / or
- Offsite sensitive receptors of groundwater; and / or
- Onsite ecological receptors on vegetated areas of the site.

4.6 Preferential Pathways

For the purpose of this assessment, preferential pathways have been identified as natural and / or man-made pathways that result in the preferential migration of COPCs as either liquids or gases.

Man-made preferential pathways may be present at the site, generally associated with services that may be present beneath the existing ground surface near the area where former dwellings were located. Service lines are anticipated to have a higher permeability than the underlying natural soils.

5. Previous Investigations

The investigations which have been undertaken on the various lots now consolidated into the site are summarised below and assessed against the Conceptual Site Model presented in **Section 4**. Where previous investigations have not adequately assessed the potential complete pathways to the identified receptors, further investigation may be warranted.

5.1 Summary Previous Investigations

A brief summary of the previous investigations completed at the site is provided below.

Table 5.1: Investigation Summary

Existing Environmental Reports	Scope	Findings
Lot 11 DP522660		
Preliminary Contamination Assessment, Geotechnique Pty Ltd 28 June 2011 (12486/1-AA) Detailed Contamination Assessment & Remediation Action Plan, Geotechnique Pty Ltd, 10 October 2011 (12486/2-AA)	The scope included the collection and analysis of discrete and composited soil samples from 28 test pits and one augered location, with subsequent delineation sampling in the detailed assessment. Samples were selectively analysed for metals (arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni) and zinc (Zn), total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene and xylenes (BTEX), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCB), and asbestos.	Laboratory analysis indicated analytes were either not present (i.e. concentrations less than laboratory LOR), or present in the sampled soils at concentrations that do not pose a risk of hazard to human health or the environment, under a "residential with access to soil" form of development. The exceptions were elevated concentrations of Cu, Ni, and Zn that could potentially impact on the growth of certain plant species. Based on the soil type typical of the site (sandy clay), the revised phytotoxicity criteria adopted by the NSW EPA in 2013 would mean that there would be only some minor exceedances of the current criteria for Zn. Scattered bonded asbestos-cement pieces were also encountered on the ground surface at a localised area, and in test pits during the detailed assessment. Fill materials were encountered at depths to about 2.8m below the existing ground level. The Detailed Contamination Assessment included a remediation strategy for the identified impacts.

Existing Environmental Reports	Scope	Findings
Lot 12 DP 522660		
Phase 2 Environmental Site Assessment, Parsons Brinkerhoff (PB), July 2009 (2116943A PR_9627 RevB.doc). Preliminary Contamination Assessment, Geotechnique Pty Ltd 28 June 2011 (12486/1-AA)	The PB scope included the collection and analysis of 29 surface soil samples and 5 test pit soil sample locations, as well as one groundwater sample (MW5). Samples were analysed for organochlorine pesticides (OCPs), metals, total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene and xylenes (BTEX), polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and asbestos. The Geotechnique scope included assessing the same analytes as PB (except including PCB and omitting VOCs) at 39 test pit locations.	PB found the site to be generally underlain by natural material or reworked natural material. Elevated Cu and Zn concentrations relative to the phytotoxicity criteria were considered to represent natural soils. It was also noted, the current and past land uses as agricultural land indicated no adverse impact on flora and no signs of plant stress were observed during site inspections. No subsurface fibrous cement sheeting was found and no soil samples detected any asbestos containing materials. However, some isolated fibrous cement fragments were observed at the surface at two locations in the upper area of the lot. The isolated fragments were bonded and non-friable in nature, therefore the likelihood of the small fragments impacting the underlying soils was considered very low. The source of the isolated fragments was considered as probably from buildings on the site. No visual observations of contamination from former or present land uses or aesthetic degradation was noted. Groundwater was found to be free from significant contamination with the exception of dissolved copper and zinc that was considered to represent background levels in the area. The lot was considered by PB to be suitable for the proposed residential land use with gardens and accessible soil. An audit of the lot conducted by an EPA Accredited Auditor (Roger Parker) concluded in September 2009 that the site was suitable for residential land use with accessible soil, including gardens (minimal home-grown produce contributing less than 10% fruit and vegetable intake), excluding poultry. Geotechnique assessment of Lot 12 was consistent with PB.
Lot 51 DP 1189505		
Preliminary Environmental Site Assessment, JBS&G Pty Ltd, 29 November 2013 (43123-56143 (Rev 0))	The JBS&G scope included a review of the available information, including Council documentation, aerial photographs, WorkCover NSW records, NSW EPA records and Heritage records, as well as a detailed site inspection, to identify potential areas of environmental concern (AECs) and associated contaminants of potential concern (COPCs).	Based on the review it was considered unlikely that activities at the site would have contaminated the land to a degree that could not be readily managed/remediated to enable future residential land use. In relation to contamination warranting further investigation, the finding was consistent with the DCP.
Lot 101 DP 564332		
Phase 2 Environmental Site Assessment, Parsons Brinkerhoff, July 2009 (2116943A PR_9627 RevB.doc). Preliminary Contamination Assessment, Geotechnique Pty Ltd 28 June 2011 (12486/1-AA).	The PB scope included the collection and analysis of 26 surface soil samples and 4 test pit sample locations, as well as one groundwater sample (MW6). Samples were analysed for OCPs, metals, TPH, benzene, BTEX, PAHs, VOCs, and asbestos. The Geotechnique scope included assessing the same analytes as PB (except including PCB and omitting VOCs) at 45 test pit locations.	PB found Lot 101 to have similar characteristics as Lot 12. However, no surface or subsurface fibrous cement sheeting was found and no soil samples detected any asbestos containing materials. For groundwater there was elevated dissolved chromium as well as copper and zinc, the concentrations were considered to represent background levels in the area. The lot was considered to be suitable for the proposed residential land use with gardens and accessible soil. An audit of the lot conducted by an EPA Accredited Auditor (Roger Parker) concluded in September 2009 that the site was suitable for residential land use with accessible soil, similar to Lot 12. Geotechnique assessment of Lot 101 was consistent with PB.

Existing Environmental Reports	Scope	Findings
Lot 1 DP 515678		
JBS&G completed a Preliminary Environmental Site Assessment for Legacy Property in September 2016.	The JBS&G scope included a review of previous reports on adjacent properties, aerial photographs, NSW EPA records and Heritage records.	Based on the review it was considered unlikely that potential contamination (if any) associated with prior land uses would preclude the residential development of the lot.
Lot 6 DP 502333		
JBS&G completed a Preliminary Environmental Site Assessment for Legacy Property in September 2016.	The JBS&G scope included a review of previous reports on adjacent properties, aerial photographs, NSW EPA records and Heritage records.	Based on the review it was considered unlikely that potential contamination (if any) associated with prior land uses would preclude the residential development of the lot.
Lot 2 DP 502333		
JBS&G completed a Preliminary Environmental Site Assessment for Legacy Property in September 2016.	The JBS&G scope included a review of previous reports on adjacent properties, aerial photographs, NSW EPA records and Heritage records.	Based on the review it was considered unlikely that potential contamination (if any) associated with prior land uses would preclude the residential development of the lot.
Lot 755 DP 1180111		
Phase 2 Environmental Site Assessment, Parsons Brinkerhoff, July 2009 (2116943A PR_9627 RevB.doc).	The PB scope included the collection and analysis of 43 surface soil samples and 11 test pit soil sample locations, as well as one groundwater sample (MW4). Samples were analysed for OCPs, metals, TPH, benzene, BTEX, PAHs, VOCs, and asbestos.	PB found Lot 755 to have similar characteristics as Lot 12. However, no surface or subsurface fibrous cement sheeting was found and no soil samples detected any asbestos containing materials. Groundwater was found to be free from significant contamination with the exception of dissolved copper and zinc that was considered to represent background levels in the area The lot was considered to be suitable for the proposed residential land use with gardens and accessible soil. An audit of the site conducted by an EPA Accredited Auditor (Roger Parker) concluded in 2011 the site was suitable for residential with accessible soil, including gardens (minimal home-grown produce, excluding poultry), day care centre, preschool, primary school etc.

5.2 QA/QC Data Evaluation

The investigations outlined in **Section 5.1** referenced the use of guidelines made or approved by the NSW Environment Protection Authority (EPA). Where intrusive investigation programs were undertaken a Data Quality Objective (DQO) process was applied to the investigation activities for the areas subject to investigation, including incorporation of a QA/QC program. The adherence to the program was assessed by the consultants as satisfactory and that the results of the investigation could be relied upon.

5.3 Assessment of Historical Data against Current Guidelines

Available data from the previous investigations were re-assessed against the health-based and environmental investigation and screening levels presented in the amended National Environment Protection (Assessment of Site Contamination) Measure (NEPM) (NEPC 2013[7]).

[7] National Environment Protection Council (NEPC) 2013, *National Environment Protection (Assessment of Site Contamination) Measure (NEPM) 1999*, amended April 2013

Based on this review, it was noted that concentrations of copper and zinc from some soil samples analysed from the site were greater than the environmental investigation / screening levels as presented in the NEPM. It is noted however, that the concentrations reported for these metals are within the range of background concentrations as presented in the Contaminated Sites Monograph Series 1995 (Olszowy, et. al. 1995[8]).

5.4 Data Gaps

In an area which shares a similar rural residential land use history, contamination related investigations have been conducted over time and have encompassed much of the site. The scope of the investigations has been consistent with the Conceptual Site Model developed for the site. In the investigation no contamination has been identified which would preclude the residential development of the site.

The vast majority of laboratory results from the intrusive investigations have been lower than detection limits or lower than the adopted assessment criteria. The consistency of the results indicates the level of uncertainty in the assessments is low and the probability that contamination may be present that has not been detected is also considered to be low.

However, three lots (Lot 1, Lot 2 and Lot 6) have had no reported contamination investigations as required by Penrith City Council's DCP for Caddens which requires a Phase 2 Environmental Site Assessment to accompany DAs for these lots. In order to address this data gap, supplementary intrusive contamination investigations have been undertaken. The investigations and results are provided in **Section 6**.

[8] Olszowy, H. Torr, P., and Imray, P. (Olszowy, et. al.) (1995), *Trace Element Concentrations in Soils from Rural and Urban Areas of Australia*, Contaminated Sites Monograph Series No. 4, 1995

6. Supplementary Investigation (Lots 1, 2 and 6)

Three lots within the site (Lot 1 in DP 515678, Lot 2 in DP 502333 and Lot 6 in DP 502333) have not been the subject of intrusive contamination investigations.

In order to complete contamination investigations to a similar level as investigations on other lots within the site, as well as satisfy the Penrith City Council's DCP for Caddens which requires a Phase 2 Environmental Site Assessment to accompany DAs, a program of soil sampling was completed for the Lots 1, 2 and 6.

6.1 Sampling and Analysis Plan

A Sampling and Analysis Plan was developed for the Lots 1, 2 and 6 based on the Conceptual Site Model presented in **Section 4** and the Data Quality Objectives (DQOs) presented in **Appendix E**.

6.1: Proposed Supplementary Investigations

Site	Site Usage	Intrusive Site Investigations
Lot 1 DP 515678 Address: 187 Caddens Road Site Area: Approx. 2.1 ha	Rural residential, including remains of derelict brick building.	Fifteen locations were subject to intrusive investigation. The level of assessment was based on the low risk of contamination and was half the sampling density tabulated in EPA guidance. This reduced sampling density is consistent with the density of investigation adopted for other lots within the site (PB, 2009). The program of investigation targeted areas of potential concern identified in the desktop review and inspection, as well as grid sampling in remaining areas.
Lot 2 DP 502333 Address: 189 Caddens Road Site Area: Approx. 1.75 ha	Rural residential with possible agricultural cultivation.	Based on the likely low risk of contamination, 14 locations sampled based on the reduced sampling density adopted elsewhere, targeting areas of potential concern as well as grid sampling in remaining areas.
Lot 6 DP 502333 Address: 189 Caddens Road Site Area: Approx. 0.07 ha	Road easement for access to rural residential properties.	Based on the likely low risk of contamination, 3 locations sampled based on the reduced sampling density adopted elsewhere, targeting areas of potential concern.

JBS&G contracted Eurofins MGT (Eurofins) as the primary laboratory for the required chemical analyses. The secondary laboratory was Envirolab Services Pty Ltd (Envirolab). Both laboratories are NATA accredited for the required analyses. In addition, the laboratories were required to meet JBS&G's internal quality assurance/quality control (QA/QC) requirements. The completed analysis schedule is summarised in **Table 6.2.**

Table 6.2: Analytical Schedule

Sample Type	Sample Type	No. of Sampling Locations	Analyses (exc. QA/QC)
Lot 1 DP 515678 Address: 187 Caddens Road	Soil	14 Test Pit Locations and 1 Hand Auger Location.	Heavy metals (As, Cd, Cr, Cu, Hg, Ni, Pb, Zn) – 18 samples PAH – 7 samples TRH/BTEX – 20 samples Asbestos Identification – 1 Sample OCPs – 8 samples Physical Parameters (CEC, pH and % Clay) – 2 samples
	Material	1 Surficial Fibrous Cement Sheeting Fragment	Asbestos Identification – 1 Sample
Lot 2 and 6 DP 502333 Address: 189 Caddens Road	Soil	17 Test Pit Locations and 3 Surficial Samples	Heavy metals (As, Cd, Cr, Cu, Hg, Ni, Pb, Zn) – 20 samples PAH – 8 samples TRH/BTEX – 22 samples Asbestos Identification – 4 Sample OCPs – 9 samples Physical Parameters (CEC, pH and % Clay) – 2 samples

In addition to the above primary analyses, to address the DQIs, field duplicate and triplicate soil samples were analysed at a rate of one per 20 primary samples for contaminants of concern. A rinsate sample was obtained from non-disposable soil sampling equipment, plus a single trip spike and single trip blank accompanied the sample batch.

6.2 Assessment Criteria

6.2.1 Regulatory Guidelines

Development of site assessment criteria and the associated scope of investigation was undertaken with consideration to aspects of the following guidelines, as relevant:

- *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013 (No. 1)*, National Environment Protection Council (NEPC 2013);
- *Contaminated Sites: Sampling Design Guidelines*, NSW EPA, 1995 (EPA 1995);
- *Contaminated Sites: Guidelines for Consultants Reporting on Contaminated Sites*, NSW OEH, 2011 (OEH 2011); and
- *Contaminated Sites: Guidelines for the NSW Site Auditor Scheme*, 2nd Edition, NSW EPA, 2006 (DEC 2006).

6.2.2 Assessment Criteria Selection

As per the decision process for assessment of urban development site (DEC 2006), a set of health and ecological assessment thresholds derived from NEPC (2013) was used for evaluation of site contamination data collected for the assessment. The site is zoned R1 – General Residential (Penrith LEP 2010). The soil data were therefore compared against NEPM (NEPC 2013) land use criteria consistent with residential scenario with accessible soils, less than 10% home grown fruit and vegetable intake but no poultry, and also includes childcare centres, preschools and primary schools.

Should a more sensitive land use be proposed, such as a residential land use with an anticipated consumption of >10% of home grown fruit and vegetable intake and / or poultry, it is recommended that a site specific risk assessment be undertaken to determine the suitability of the site for these uses.

The adopted site criteria are presented in **Table A,** the soil analytical summary tables. Relevant guidelines are presented below:

- Health based Investigation Levels (HILs) for residential with garden/accessible soils (home grown produce <10% fruit and vegetable intake and no poultry) and also includes childcare centres, preschools and primary schools (HIL-A);
- Health Screening Levels (HSLs) for petroleum hydrocarbons considering potential for vapour intrusion within fine grained soils for low-high density residential land use (HSL A & HSL B);
- Ecological Investigation/Screening Levels (EILs/ESLs) for urban residential land use; and
- Health screening levels for asbestos contamination in soil for residential land use with garden/accessible soils including children's day care centres, preschools and primary schools (HSL A).

Where there are no NSW EPA endorsed thresholds for individual COPC the laboratory limit of reporting (LOR) was adopted as an initial screening value for the purposes of this assessment.

6.2.3 Derivation of Site Specific Ecological Investigation Levels

Site specific EILs were derived in accordance with the methodology outlined within NEPM (NEPC 2013). Four representative soil samples (TP01 0-0.1, TP11 0.2-0.3, TP18 0.2-0.3 and TP32 0.2-0.3) were submitted for laboratory analysis to determine physiochemical parameters including Cation

Exchange Capacity (CEC), pH and % Clay. Detailed laboratory reports and chain of custody documentation is provided in **Appendix F**.

Values for Average Background Concentrations (ABCs) were obtained from Trace Element Concentrations in Soils from Rural and Urban Areas of Australia (Olzworthy *Et Al*. 1995).

Table 6.5 details ABCs, Added Contaminant Limits and derived EILs. All values are in mg/kg unless otherwise specified.

Table 6.5: Derivation of EILs

Physical Parameters			
Cation Exchange Capacity (meq/100g)		**pH (pH units)**	**% Clay**
16		6.7	33
19		7.9	25
14		7.3	33
15		6.9	33
16 (Average)		7.2 (Average)	32 (Average)
EILS			
Contaminant	**ABC**	**ACL**	**EIL**
Zinc	142	400	542
Copper	49	190	239
Chromium (III)	12	400	412
Nickel	6	170	176
Lead	303	1100	1403
Arsenic	8	100	108
DDT	-	180	180
Naphthalene	-	170	170

6.3 Results

6.3.1 Quality Assurance/Quality Control

A detailed Quality Assurance/Quality Control (QA/QC) analysis was undertaken on the analytical data set pertaining to the data gap investigation and is presented in **Appendix G.** Based on the results of the field and laboratory QA/QC program, the soil data is of an acceptable quality upon which to draw conclusions regarding the environmental condition of the site.

6.3.2 Soil Observations

Soil sampling was conducted on 10 October 2016 at the sampling locations shown on **Figure 4**. Borehole logs are included in **Appendix H**.

The majority of the investigation area was unsealed ground covered grass tussocks and larger vegetation, with the remainder of the unsealed surfaces either exposed or occupied by some small shrubs and larger trees.

A summary of soil conditions present at the site is presented as follows. A total of 31 test pits and one hand auger borehole were advanced from the ground surface to natural material. Test pits generally encountered natural clays and silty clays at the ground surface with the exception of three locations. At two locations (TP13 and TP16) shallow fill (0.2 m bgs) was encountered and at one location (TP26) deep fill was encountered (0.8 m bgs). Fill material at all three locations encountered was the result of anthropogenic items mixed with natural soils being laid in small stockpiles, slightly elevated from the surrounding ground surface. No burial of fill material was encountered at any of the test pit locations. Fill material generally comprised site won natural materials (clayey silts and silty clays varying in colour, primarily brown, red and orange with low to no plasticity and varying in consistency from soft to hard) silty clay with inclusions of anthropogenic materials in the form of bricks, tiles, sandstone, concrete cobbles, glass, igneous gravels and concrete boulders. No ACM, odours or staining was observed within the soil profile at any investigation location.

Surficial ACM was observed at some locations within the rubble from an historical demolition of onsite structures as indicated on **Figure 3**. Odourous surficial soil was observed within the vicinity of the septic tank identified to the east of the residence on Lot 2.

Surficial staining was observed surrounding a fence post to the southeast of the residence, the current site occupant advised JBS&G that the staining was from the application of sump oil to the fence post. Minor areas of burnt rubbish were observed as indicated on **Figure 3** and rubbish was observed on site surfaces in several locations. No odours or staining were observed within the soil profile at any investigation location. No PID readings above the instrument's level of detection were observed during field screening for volatiles during soil sampling.

6.3.3 Soil Contamination Analytical Results

Detailed laboratory reports and chain of custody documentation are provided in **Appendix F**. Summarised soil analytical data for COPCs are presented in **Table A** and are discussed in the following sections.

6.3.3.1 Metals

All individual heavy metals concentrations were reported at concentrations less than the adopted health and ecological based assessment criteria.

6.3.3.2 PAHs

Total PAH, B(a)P and carcinogenic PAHs as B(a)P Toxic Equivalence Quotient (TEQ) values for all analysed samples were reported at concentrations less than the adopted site assessment criteria.

6.3.3.3 TRH and BTEX

Concentrations of all TRH were reported below the laboratory LOR and the adopted health and ecological site assessment criteria in all soil samples selected for analysis.

Concentrations of all BTEX were reported below the laboratory LOR and the adopted health and ecological site assessment criteria in all soil samples selected for analysis.

6.3.3.4 OCPs/PCBs

Concentrations of OCP compounds were reported below the adopted health and ecological assessment criteria for all soil samples selected for analysis.

Concentrations of total PCB compounds were reported below the laboratory LOR and the adopted health and ecological assessment criteria for all soil samples selected for analysis

6.3.3.5 Asbestos

Bonded ACM was observed on site surfaces during investigation within the vicinity of the demolished residential structure present on Lot 1. An asbestos fragment was also detected in the surface soil sample submitted for analysis from location TP16 0-0.1 on Lot 2.

6.4 Discussion

Based on the decision making process for assessing urban redevelopment sites detailed in DEC (2006) and discussed in **Appendix E**, the decisions required to be made are discussed below.

6.4.1 Potential Risks to Future Onsite Receptors

Concentrations of COPC in all samples analysed were reported below the adopted site criteria. Asbestos containing material (ACM) was observed on site surfaces within the vicinity of the demolished residential structure in Lot 6, as shown in **Figure 3**, which constitutes an exceedance of the HSL criterion for visible ACM. With the appropriate removal of incidental finds of ACM, there are no unacceptable risks to future human site occupants or ecological receptors under the proposed land use scenario.

6.4.2 Background Soil Contamination

Metals concentrations within soil samples analysed were within published background ranges as outlined in **Section 6.2**.

6.4.3 Chemical Mixtures

There were no soils identified with significant concentrations of more than one contaminant of concern and so no potential chemical mixtures identified during the investigation that may pose an unacceptable contamination risk at the site with respect to future site users.

6.4.4 Aesthetic Issues

As discussed in **Section 6.3.2**, surficial staining was observed surrounding a fence post to the south east of the residence on Lot 2. Minor areas of rubbish, in addition to incinerated rubbish, were observed in several locations. This may pose an unacceptable aesthetic issue requiring management prior to the site being occupied for the proposed land use.

Odourous surficial soil was observed within the vicinity of the septic tank identified to the east of the residence on Lot 2. No other odourous soils were observed during the site inspection and sampling activities.

Visible ACM in the form of fibre cement fragments were observed in the vicinity of the demolished residential building. This poses an unacceptable aesthetic issue which will require management prior to the site being utilised for the proposed land use.

6.4.5 Potential Migration of Contaminants

Based on the absence of significant contaminant mass in soils, unacceptable contaminant migration risks are not apparent for the investigation area.

6.4.6 Site Management Strategy

Aesthetic risks can be addressed prior to the investigation area being utilised for the proposed land use by an emu pick of visible ACM from site surfaces, the disposal of surficial rubbish and disposal of the incinerated rubbish. Odourous soils within the vicinity of the septic tank, if identified as posing an unacceptable aesthetic risk, should be disposed of or otherwise controlled to limit their odour emission.

Typical site management controls including protocols to manage unexpected finds should be implemented during any ground disturbance works associated with site development.

7. Conclusions and Recommendations

Based on the review of available information, site inspection and supplementary intrusive investigations, no contamination which would preclude the residential development of the site has been identified.

It is recommended that the RAP developed for Lot 11 DP522660 is implemented prior to redevelopment of the lot.

For the overall site, and based on the scope of work completed for this assessment and subject to the limitations in **Section 8**, it is recommended that work, health, safety and environmental management controls (including protocols to manage unexpected finds) should be implemented during any future ground disturbance works.

8. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquires.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

List of NSW contaminated sites notified to EPA

Background

A strategy to systematically assess, prioritise and respond to notifications under Section 60 of *the Contaminated Land Management Act 1997* (CLM Act) has been developed by the EPA. This strategy acknowledges the EPA's obligations to make information available to the public under *Government Information (Public Access) Act 2009*.

When a site is notified to the EPA, it may be accompanied by detailed site reports where the owner has been proactive in addressing the contamination and its source. However, often there is minimal information on the nature or extent of the contamination.

For some notifications, the information indicates the contamination is securely immobilised within the site, such as under a building or carpark, and is not currently causing any offsite consequences to the community or environment. Such sites would still need to be cleaned up, but this could be done in conjunction with any subsequent building or redevelopment of the land. These sites may not require intervention under the CLM Act, but could be dealt with through the planning and development consent process.

Where indications are that the nominated site is causing actual harm to the environment or an unacceptable offsite impact (i.e. it is a 'significantly contaminated site'), the EPA would apply the regulatory provisions of the CLM Act to have the responsible polluter and/or landowner investigate and remediate the site.

As such, the sites notified to the EPA and presented in the following table are at various stages of the assessment and/or remediation process. Understanding the nature of the underlying contamination, its implications and implementing a remediation program where required, can take a considerable period of time. The tables provide an indication, in relation to each nominated site, as to the management status of that particular site. Further detailed information may be available from the EPA or the responsible landowner.

The following questions and answers may assist those interested in this issue:

Frequently asked questions

What is the difference between the 'List of NSW contaminated sites notified to EPA' and the 'Contaminated Land: Record of Notices'?

A site will be on the Contaminated Land: Record of Notices only if the EPA has issued a regulatory notice in relation to the site under the *Contaminated Land Management Act 1997*.

The sites appearing on this 'List of NSW contaminated sites notified to the EPA' indicate that the notifiers consider that the sites are contaminated and warrant reporting to EPA. However, the contamination may or may not be significant enough to warrant regulation by the EPA. The EPA needs to review and, if necessary, obtain more information before it can make a determination as to whether the site warrants regulation.

Why does my site appear on the list?

Your site appears on the list for one or more of the following reasons:

- The site owner and/or the person partly or fully responsible for causing the contamination notified the EPA about the contamination under Section 60 of the *Contaminated Land Management Act 1997*. In other words, the site owner or the 'polluter' believes the site is contaminated.
- The EPA has been notified via other means and is satisfied that the site is or was contaminated.

Does the list contain all contaminated sites in NSW?

No. The list only contains contaminated sites that EPA is aware of, with regard to its regulatory role under the CLM Act. An absence of a site from the list does not necessarily imply the site is not contaminated.

The EPA relies upon responsible parties to notify contaminated sites.

How are notified contaminated sites managed by the EPA?

There are different ways that the EPA manages these notified contaminated sites. First, an initial assessment is carried out by the EPA. At the completion of the initial assessment, the EPA may take one or more than one of the following management approaches:

- The contamination warrants the EPA's direct regulatory intervention either under the *Contaminated Land Management Act 1997* or the *Protection of the Environment Operations Act 1997* (POEO Act), or both. Information about current or past regulatory action on this site can be found on the EPA website.
- The contamination with respect to the current use or approved use of the site, as defined under the *Contaminated Land Management Act 1997,* is not significant enough that it warrants EPA regulation.
- The contamination does not require EPA regulation and can be managed by a planning approval process.
- The contamination is related to an operational underground petroleum storage system, such as a service station or fuel depot. The contamination may be managed under the POEO Act and the Protection of the Environment Operation (Underground Petroleum Storage Systems) Regulation 2014.

Note: There are specific instances where contamination is managed under a specifically tailored program operated by another agency. For example the NSW Resouces & Energy's Derelict mines program and the NSW DPI Cattle tick dip site locator.

The Legacy contamination management procedures for these sites will be detailed in a Memorandum of Understanding between the NSW EPA, NSW Resources and Energy and Dept. Primary Industries (Crown Lands and Biosecurity) (Note: the MoU is currently in draft).

I am the owner of a site that appears on the list. What should I do?

First of all, you should ensure the current use of the site is compatible with the site contamination. Secondly, if the site is the subject of EPA regulation, make sure you comply with the regulatory requirements, and you have considered your obligations to notify other parties who may be affected.

If you have any concerns, contact us and we may be able to offer you general advice, or direct you to accredited professionals who can assist with specific issues.

I am a prospective buyer of a site that appears on the list. What should I do?

You should seek advice from the vendor to put the contamination issue into perspective. You may need to seek independent expert advice.

The information provided in the list, particularly the EPA site management class, is meant to be indicative only, and a starting point for your own assessment. Site contamination as a legacy of past site uses is not uncommon, particularly in an urban environment. If the contamination on a site is properly remediated or managed, it may not materially impact upon the intended future use of the site. However, each site needs to be considered in context.

List of NSW contaminated sites notified to the EPA

Disclaimer

The EPA has taken all reasonable care to ensure that the information in the list of contaminated sites notified to the EPA (the list) is complete and correct. The EPA does not, however, warrant or represent that the list is free from errors or omissions or that it is exhaustive.

The EPA may, without notice, change any or all of the information in the list at any time.

You should obtain independent advice before you make any decision based on the information in the list.

The list is made available on the understanding that the EPA, its servants and agents, to the extent permitted by law, accept no responsibility for any damage, cost, loss or expense incurred by you as a result of:

1. any information in the list
2. any error, omission or misrepresentation in the list
3. any malfunction or failure to function of the list
4. without limiting (2) or (3) above, any delay, failure or error in recording, displaying or updating information.

The following information, is also available in this printable document: List of NSW Contaminated Sites Notified to the EPA as of 30 August 2016 (PDF 889KB).

EPA site management class	Explanation
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or *Protection of the Environment Operations Act 1997*. Alternatively, the EPA may require information via a notice issued under s77 of the *Contaminated Land Management Act 1997* or issue a Preliminary Investigation Order.
Regulation under CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the *Contaminated Land Management Act 1997* is not required.
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997*. A regulatory approach is being finalised.
Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the *Protection of the Environment Operations Act 1997* (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the *Environmental Planning and Assessment Act 1979* (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the *Protection of the Environment Operations Act 1997 (POEO Act).*
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the *Environmental Planning and Assessment Act 1979* (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the *Contaminated Land Management Act 1997* (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record.

List current as of 30 August 2016.

Search for NSW heritage

Return to search page where you can refine/broaden your search.

Statutory listed items

Information and items listed in the State Heritage Inventory come from a number of sources. This means that there may be several entries for the same heritage item in the database. For clarity, the search results have been divided into three sections.

- **Section 1** - contains Aboriginal Places declared by the **Minister for the Environment** under the National Parks and Wildlife Act. This information is provided by the Heritage Division.
- **Section 2** - contains heritage items listed by the **Heritage Council of NSW** under the NSW Heritage Act. This includes listing on the State Heritage Register, an Interim Heritage Order or protected under section 136 of the NSW Heritage Act. This information is provided by the Heritage Division.
- **Section 3** - contains items listed by **local councils** on Local Environmental Plans under the Environmental Planning and Assessment Act, 1979 and **State government agencies** under s.170 of the Heritage Act. This information is provided by local councils and State government agencies.

Section 1. Aboriginal Places listed under the National Parks and Wildlife Act.

Your search did not return any matching results.

Section 2. Items listed under the NSW Heritage Act.

Your search returned 28 records.

Key:
LGA = Local Government Area
GAZ= NSW Government Gazette (statutory listings prior to 1997), HGA = Heritage Grant Application, HS = Heritage Study, LGOV = Local Government, SGOV = State Government Agency.
Note: While the Heritage Division seeks to keep the Inventory up to date, it is reliant on State agencies and local councils to provide their data. Always check with the relevant State agency or local council for the most up-to-date information.

Appendix E Data Quality Objectives

E.1 Sampling and Analysis Quality Plan

Data Quality Objectives (DQOs) were established for the assessment works, as described in the following sections.

E.1.1 State the Problem

It is understood that the Site owner, Legacy Property, requires an assessment of the potential risks to human health and the environment associated with site contamination under the current land use specified for the site, as discussed in **Section 1**. As part of this assessment, a data gap investigation was undertaken comprising intrusive soil investigations and site inspections at three properties Lot 1 in DP 515678, Lot 2 in DP 502333 and Lot 6 in DP 502333.

Information on potential site contamination conditions inferred from the desktop review, previous site investigation, and observations made during site inspection was the basis for the conceptual site model information presented in **Section 4.**

E.1.2 Identify the Decision

Based on the decision making process for assessing urban redevelopment sites detailed in DEC (2006[9]), the following decisions must be made:

- Are there any unacceptable risks to likely future onsite receptors?
- Are there any issues relating to background soil concentrations that exceed appropriate site soil criteria?
- Are there any impacts of chemical mixtures?
- Are there any aesthetic issues at the Site?
- Is there any evidence of, or potential for, migration of contaminants from the Site?
- Is a site management strategy required?

E.1.3 Identify Inputs to the Decision

Inputs identified to provide sufficient data to make the decisions nominated above include:

- Desktop review;
- Detailed site inspection/walkover;
- Physical observations and interpretation of fill and natural material through the collection of soil samples and laboratory chemical analysis results;
- Development of appropriate assessment criteria for evaluation of soil impacts;
- Laboratory analysis of soil samples of potentially contaminated media for COPCs; and
- Confirmation that data generated by sample analysis are of an acceptable quality to allow reliable comparison to assessment criteria by assessment of quality assurance / quality control as per the data quality indicators established in **Section E.6**.

Specifically, sufficient data needs to be collected from each of the identified potentially impacted media in the identified AEC for the associated COPC (**Table 4.1**).

E.1.4 Define the Study Boundaries

[9] *'Contaminated Sites: Guidelines for the NSW Site Auditor Scheme, 2nd* Edition', NSW Environmental Protection Authority, EPA 2006

The lateral study boundary is defined as Lot 1 in DP 515678, Lot 2 in DP 502333 and Lot 6 in DP 502333, as shown on **Figure 2**. The maximum vertical extent of the assessment works was at 1.0 m below the existing ground surface.

Due to the project objectives, seasonality was not assessed as part of this investigation. Data are therefore representative of the timing and duration of the current investigation.

E.1.5 Develop a Decision Rule

Soil analytical data were assessed against the appropriate criteria as identified in **Section 6.2**. Statistical analyses of the data were undertaken, where appropriate in accordance with relevant guidance documents. The following statistical criteria were adopted:

- The 95% Upper Confidence Limit (UCL) on the average concentration for each analyte (calculated for samples collected from consistent soil horizons, stratigraphy or material types) must be below the adopted criterion;
- No single analyte concentration shall exceed 250% of the adopted criterion; and
- The standard deviation of the results must be less than 50% of the criterion.

The decision rules adopted to answer the decisions identified in **Section E.1.2** are summarised in **Table E.1**.

Table E.1: Summary of Decision Rules

Decisions Required to be Made	Decision Rule
1. Are there any unacceptable risks to onsite future receptors?	Analytical data was compared against EPA endorsed criteria. Statistical analysis of the data was completed in accordance with relevant guidance documents, as appropriate, to facilitate the decisions. The criteria in **Section 6.3**, and the following statistical criteria were adopted with respect to soils: Either: the reported concentrations were all below the Site criteria; Or: the average site concentration for each analyte was below the adopted site criterion; no single analyte concentration exceeded 250% of the adopted site criterion; and the standard deviation of the results was less than 50% of the Site criterion; And: the 95% UCL of the average concentration for each analyte was below the adopted site criterion. If the statistical criteria stated above were satisfied, the answer to the decision was No. If the statistical criteria were not satisfied, the answer to the decision was Yes.
2. Are there any background contamination issues?	Background soil concentrations as detailed in Trace Element Concentrations in Soils from Rural and Urban Areas of Australia (Olszowy, et. al. 1995) were used for comparison of site soil data. If there were any contaminants at concentrations substantially outside background ranges, then the answer was yes, otherwise the answer was no
2. Are there any chemical mixtures?	Was there more than one group of contaminants present which increase the risk of harm? If there was, the answer to the decision was Yes. Otherwise, the answer to the decision was No.
3. Are there any aesthetic issues?	If there were any Asbestos Containing Material (ACM) fragments on the ground surface, any unacceptable odours, any soil discolouration, or excessive amounts of anthropogenic material, the answer to the decision was Yes. Otherwise, the answer to the decision was No.
4. Is there any evidence of, or potential for, migration of contaminants from the Site?	Based on assessment results, was there any evidence of, or the potential for, unacceptable contaminant concentrations to migrate from the Site? If yes, the answer to the decisions was Yes. Otherwise, the answer to the decision was No.
5. Is a site management strategy required?	Is the answer to any of the above decisions Yes?

Decisions Required to be Made	Decision Rule
	If yes, a site management strategy is required to address unacceptable contamination concerns at the Site so as to make the Site suitable for permissible site uses. If no, a site management strategy is not required and the Site is considered suitable, from a contamination view point for the proposed use.

E.1.6 Specific Limits on Decision Errors

This step is to establish the decision maker's tolerable limits on decision errors, which are used to establish performance goals for limiting uncertainty in the data. Data generated during this project must be appropriate to allow decisions to be made with confidence.

Specific limits for this project have been adopted in accordance with the appropriate guidance from the NSW EPA, National Environmental Protection Measure (NEPM) (NEPC 2013[10]), appropriate Data Quality Indicators (DQIs, used to assess quality assurance / quality control) and standard JBS&G procedures for field sampling and handling.

To assess the usability of the data prior to making decisions, the data will be assessed against pre-determined DQIs for to precision, accuracy, representativeness, comparability, completeness and sensitivity (PARCCS parameters). The acceptable limit on decision error is 95% compliance with DQIs.

The pre-determined DQIs established for the project are discussed below in relation to the PARCCS parameters, and are shown in **Table E.2**.

- **Precision** - measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** - measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** – expresses the degree which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the Site, and by using an adequate number of sample locations to characterise the Site to the required accuracy.
- **Comparability** - expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples; and ensuring analysing laboratories use consistent analysis techniques; and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** – expresses the appropriateness of the chosen field and laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted site assessment criteria.

[10] National Environmental Protection (Assessment of Site Contamination) Measure 1999. As compiled 16 May 2013 National Environmental Council (NEPC 2013)

Table E.2: Data Quality Indicators

Data Quality Indicators	Frequency	Data Quality Criteria
Precision		
Split duplicates (intra laboratory)	1 / 20 samples	<50% RPD[1]
Blind duplicates (inter laboratory)	1 / 20 samples	<50% RPD[1]
Laboratory Duplicates	1 / 20 samples	<50% RPD[1]
Accuracy		
Surrogate spikes	All organic samples	70-130%
Laboratory control samples	1 per lab batch	70-130%
Matrix spikes	1 per lab batch	70-130%
Representativeness		
Sampling appropriate for media and analytes	All samples	-[2]
Samples extracted and analysed within holding times.	-	Soil: organics (14 days), inorganics (6 months)
Laboratory Blanks	1 per lab batch	<LOR
Trip spike	1 per lab batch	70-130% recovery
Storage blank	1 per lab batch	<LOR
Rinsate sample	1 per sampling event/media	<LOR
Comparability		
Standard operating procedures for sample collection & handling	All Samples	All Samples
Standard analytical methods used for all analyses	All Samples	NATA accreditation
Consistent field conditions, sampling staff and laboratory analysis	All Samples	All samples[2]
Limits of reporting appropriate and consistent	All Samples	All samples[2]
Completeness		
Sample description and COCs completed and appropriate	All Samples	All samples[2]
Appropriate documentation	All Samples	All samples[2]
Satisfactory frequency and result for QC samples		95% compliance
Data from critical samples is considered valid	-	Critical samples valid
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted Site assessment criteria	All samples	LOR ≤ site assessment criteria

[1] If the RPD between duplicates is greater than the pre-determined data quality indicator, a judgment will be made as to whether the excess is critical in relation to the validation of the data set or unacceptable sampling error is occurring in the field.

[2] A qualitative assessment of compliance with standard procedures and appropriate sample collection methods will be completed during the DQI compliance assessment.

E.2 Optimise the Design for Obtaining Data

Various strategies for developing a statistically based sampling plan are identified in *Contaminated Sites: Sampling Design Guidelines* (EPA 1995), including judgemental, random, systematic and stratified sampling patterns. The adopted sampling methodology is discussed in the following sections.

E.2.1 Soil Investigation Methodology

The number of sampling points required to address the data gap as part of this assessment are indicated in **Table 6.1**. Sampling points were placed on a general systematic grid, skewed towards AECs identified during the site inspection. **Table E.3** details the number and type of systematic and targeted locations advanced into each property.

Table E.3: Soil Sampling Point Summary

Property	Area (ha)	Systematic Test Pits	Targeted Hand Auger Boreholes	Surficial Fragments	Total Investigation Locations
Lot 1 DP 515678 Address: 187 Caddens Road	2.1	14	1	1	16
Lot 2 DP 502333 Address: 189 Caddens Road	1.75	14	3	-	17
Lot 6 DP 502333 Address: 189 Caddens Road	0.07	3	-	-	3

The soil sampling and analysis program is presented in **Table E.4**.

Based on the current CSM and understanding of the Site's historical use, limited potential for widespread or gross contamination, and regional hydrogeological conditions, investigation of groundwater was considered unnecessary to meet the data gap assessment objectives.

E.2.2 Soil Sampling Methodology

Soil sampling was completed by a combination of mechanically advanced test pits using a backhoe and manually advanced boreholes using a hand auger. Soil samples were collected from the soil surface (0-0.1 m) and the subsurface (0.2-0.3 m) in all locations with the exception of TP26, where deep fill was encountered and a sample of natural material was collected at 0.9-1.0 m, underlying the fill material. Additionally, asbestos quantification was undertaken in accordance with methods outlined in the NEPM (NEPC 2013) including collection of a known volume of soil (10 L) and processing through a 7 mm sieve to identify asbestos containing materials

During the collection of soil samples, features such as seepage, discolouration, staining, odours and other indicators of contamination were noted. A calibrated Photo Ionisation Detector (PID) was utilised to screen for volatile organic compounds (VOCs) within the sampled material. Calibration records are presented in **Appendix I**.

Soil samples were collected using a trowel and new pair of nitrile gloves and immediately transferred to laboratory supplied sample jars and bags. The sample containers were then transferred to a chilled esky for sample preservation prior to and during shipment to the testing laboratory. A chain-of-custody form was completed and forwarded with the samples to the testing laboratory. Based upon field observations, samples were analysed in accordance with the analytical schedule detailed in **Table E.4**.

E.2.3 Decontamination

Prior to the commencement of sampling activities, non-disposable sampling equipment, including the hand trowel and hand auger, was cleaned with a high pressure water/detergent spray, rinsed with water and then air dried. The equipment was then inspected to ensure that no soil, oil, debris or other contaminants were apparent on the equipment prior to the commencement of works.

Soil samples were removed from the hand auger head with the hand trowel and laid on clean plastic sheets for inspection prior to collection. A new pair of disposable nitrile gloves were used to collect each sample.

Sampling equipment was subsequently decontaminated using the above process between each sampling location. Decontamination records are presented in **Appendix I**.

A rinsate sample from the trowel was collected at the completion of field sampling activities to determine the effectiveness of the decontamination procedures implemented on re-usable sampling equipment.

E.2.4 Duplicate and Triplicate Sample Preparation

At selected sample locations sufficient soil was collected to provide a primary, blind (intra-laboratory) duplicate and split (inter-laboratory) duplicate (triplicate) sample using the sampling methodology outlined above.

The collected soil sample was divided laterally into three samples with minimal disturbance to reduce the potential for loss of volatiles and placed in three clean glass jars and sample bags as appropriate. Soil samples were not homogenised in order to minimise the loss of volatiles.

Each sample was labelled with primary, duplicate or triplicate sample identification before being placed in the same chilled esky for transport to the laboratory.

E.2.5 Laboratory Analysis

JBS&G contracted Eurofins MGT (Eurofins) as the primary laboratory for the required chemical analyses. The secondary laboratory was Envirolab Services Pty Ltd (Envirolab). Both laboratories were NATA accredited for the required analyses. In addition, the laboratories were required to meet JBS&G's internal quality assurance/quality control (QA/QC) requirements. The completed analysis schedule is summarised in **Table E.4.**

Table E.4: Analytical Schedule

Sample Type	Sample Type	No. of Sampling Locations	Analyses (exc. QA/QC)
Lot 1 DP 515678 Address: 187 Caddens Road	Soil	14 Test Pit Locations and 1 Hand Auger Location.	Heavy metals (As, Cd, Cr, Cu, Hg, Ni, Pb, Zn) – 18 samples PAH – 7 samples TPH/BTEX – 20 samples Asbestos Identification – 1 Sample OCPs – 8 samples Physical Parameters (CEC, pH and % Clay) – 2 samples
	Material	1 Surficial Fibrous Cement Sheeting Fragment	Asbestos Identification – 1 Sample
Lot 2 and 6 DP 502333 Address: 189 Caddens Road	Soil	17 Test Pit Locations and 3 Surficial Samples	Heavy metals (As, Cd, Cr, Cu, Hg, Ni, Pb, Zn) – 20 samples PAH – 8 samples TPH/BTEX – 22 samples Asbestos Identification – 4 Sample OCPs – 9 samples Physical Parameters (CEC, pH and % Clay) – 2 samples

In addition to the above primary analyses, to address the DQIs, field duplicate and triplicate soil samples were analysed at a rate of one per 20 primary samples for contaminants of concern. A rinsate sample was obtained from non-disposable soil sampling equipment, plus a single trip spike and single trip blank accompanied the sample batch.

Sample Receipt Advice

Company name:	**JBS & G Australia (NSW & WA) P/L**
Contact name:	Rohan Hammond
Project name:	CADDENS DSI
Project ID:	52116
COC number:	08150-53
Turn around time:	5 Day
Date/Time received:	Oct 11, 2016 5:20 PM
Eurofins | mgt reference:	**519296**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 6 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Extra sample received TP15_0.1 (jar) placed on hold | Bag only received TP13_0-0.1 and TP13_0.3; asbestos only conducted

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Attention:	Rohan Hammond
Report	519296-AID
Project Name	CADDENS DSI
Project ID	52116
Received Date	Oct 11, 2016
Date Reported	Oct 18, 2016

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, “Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise” therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Project Name CADDENS DSI
Project ID 52116
Date Sampled Oct 10, 2016
Report 519296-AID

Client Sample ID	Eurofins | mgt Sample No.	Date Sampled	Sample Description	Result
TP13_0-0.1	16-Oc10353	Oct 10, 2016	Approximate Sample 578g Sample consisted of: Brown coarse grain soil and rocks	No asbestos detected. Organic fibre detected. No respirable fibres detected.
TP16_0-0.1	16-Oc10358	Oct 10, 2016	Approximate Sample 740g Sample consisted of: Brown coarse grain soil and rocks	Chrysotile, amosite and crocidolite asbestos detected in weathered and unweathered fibre cement fragments. Approximate raw weight of asbestos containing material = 0.8584g Organic fibre detected. No respirable fibres detected.
TP26_0-0.1	16-Oc10374	Oct 10, 2016	Approximate Sample 740g Sample consisted of: Brown coarse grain soil and rocks	No asbestos detected. Organic fibre detected. No respirable fibres detected.
TP29_0-0.1	16-Oc10379	Oct 10, 2016	Approximate Sample 570g Sample consisted of: Brown coarse grain soil and rocks	No asbestos detected. Organic fibre detected. No respirable fibres detected.
ACM01	16-Oc10385	Oct 10, 2016	Approximate Sample 78g Sample consisted of: Grey compressed fibre cement material	Chrysotile, amosite and crocidolite asbestos detected.
QC03	16-Oc10388	Oct 10, 2016	Approximate Sample 693g Sample consisted of: Brown coarse grain soil and rocks	No asbestos detected. Organic fibre detected. No respirable fibres detected.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Asbestos - LTM-ASB-8020	Sydney	Oct 12, 2016	Indefinite

Internal Quality Control Review and Glossary

General

1. QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Samples were analysed on an 'as received' basis.
4. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

Units

% w/w: weight for weight basis	grams per kilogram
Filter loading:	fibres/100 graticule areas
Reported Concentration:	fibres/mL
Flowrate:	L/min

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
COC	Chain of custody
SRA	Sample Receipt Advice
ISO	International Stardards Organisation
AS	Australian Standards
WA DOH	Western Australia Department of Health
NOHSC	National Occupational Health and Safety Commission
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed-on fireproofing, troweled-on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).
PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substatntial degree of damage which increases the potential for fibre release.)
AC	Asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios).

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N/A	Not applicable

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Oct 13, 2016	14 Day
- Method: TRH C6-C36 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Oct 13, 2016	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Oct 13, 2016	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
BTEX	Melbourne	Oct 13, 2016	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Polycyclic Aromatic Hydrocarbons	Melbourne	Oct 13, 2016	14 Day
- Method: USEPA 8270 Polycyclic Aromatic Hydrocarbons			
Organochlorine Pesticides	Melbourne	Oct 13, 2016	14 Day
- Method: USEPA 8081 Organochlorine Pesticides			
% Clay	Brisbane	Oct 13, 2016	6 Day
- Method: LTM-GEN-7040			
pH (1:5 Aqueous extract)	Melbourne	Oct 13, 2016	7 Day
- Method: LTM-GEN-7090 pH in soil by ISE			
Metals M8	Melbourne	Oct 13, 2016	28 Days
- Method: LTM-MET-3030 by ICP-OES (hydride ICP-OES for Mercury)			
Conductivity (1:5 aqueous extract at 25°C)	Melbourne	Oct 13, 2016	7 Day
- Method: LTM-INO-4030			
Ion Exchange Properties	Melbourne	Oct 14, 2016	
% Moisture	Melbourne	Oct 12, 2016	14 Day
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Nephelometric Turbidity Units

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs 20-130%

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Oct 13, 2016	7 Day
- Method: TRH C6-C36 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Oct 12, 2016	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Oct 13, 2016	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
BTEX	Melbourne	Oct 12, 2016	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Polycyclic Aromatic Hydrocarbons	Melbourne	Oct 13, 2016	7 Day
- Method: USEPA 8270 Polycyclic Aromatic Hydrocarbons			
Organochlorine Pesticides	Melbourne	Oct 13, 2016	7 Day
- Method: USEPA 8081 Organochlorine Pesticides			
Metals M8	Melbourne	Oct 12, 2016	28 Days
- Method: LTM-MET-3040 Metals in Waters by ICP-MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Nephelometric Turbidity Units

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs 20-130%

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample log in details:

Your Reference:	**52116, Caddens DSI**		
No. of samples:	3 Soils		
Date samples received / completed instructions received	11/10/16	/	11/10/16

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Asbestos ID - soils		
Our Reference:	UNITS	155048-3
Your Reference	----------	QC03A
	-	
Date Sampled	----------	10/10/2016
Type of sample		Soil
Date analysed	-	17/10/2016
Sample mass tested	g	Approx 75g
Sample Description	-	Brown coarse-grained soil & rocks
Asbestos ID in soil	-	No asbestos detected at reporting limit of 0.1g/kg Organic fibres detected
Trace Analysis	-	No asbestos detected

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'TEQ PQL' values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'TEQ zero' values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'TEQ half PQL' values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore" Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-001	Asbestos ID - Qualitative identification of asbestos in bulk samples using Polarised Light Microscopy and Dispersion Staining Techniques including Synthetic Mineral Fibre and Organic Fibre as per Australian Standard 4964-2004.

Report Comments:

Asbestos: Excessive sample volume was provided for asbestos analysis. A portion of the supplied sample was sub-sampled according to Envirolab procedures. We cannot guarantee that this sub-sample is indicative of the entire sample. Envirolab recommends supplying 40-50g (50mL) of sample in its own container as per AS4964-2004.

Note: Sample 155048-3 were sub-sampled from bag provided by the client.

Asbestos ID was analysed by Approved Identifier: Paul Ching

LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Appendix G Quality Assurance / Quality Control

G.1 QA/QC Results

Analysis of the Quality Analysis / Quality Control (QA/QC) has thus been undertaken for analytical results from the site. QA/QC results for soil samples collected at the site are summarised in **Table G.1** and discussed in **Section G.2**. Detailed laboratory QA/QC results are included as part of the laboratory reports in **Appendix F**, and JBS&G's review of laboratory supplied of Quality Assurance/ Quality Control data is presented in **Appendix J.**

Table G.1: QA/QC Results Summary

Data Quality Indicator	Results	DQI met?
Precision		
Soil Blind duplicates (intra laboratory)	0-33 % RPD Intra laboratory samples were analysed at a rate greater than 1 in 20 samples.	Yes
Soil Blind triplicates (inter laboratory)	0-58% RPD Intra laboratory samples were analysed at a rate greater than 1 in 20 samples.	Partial[1]
Laboratory duplicates	0-26% RPD Intra laboratory samples were analysed at a rate of 1 in 20 samples.	Yes
Accuracy		
Surrogate spikes	50- 149% Recovery Surrogate spikes were completed for all organic samples	Partial[1]
Laboratory Control Samples	70-128% Recovery Laboratory control samples were completed for all organic and metals samples	Yes
Matrix spikes	70-130% Recovery Matrix spikes were completed for all organic and metals samples	Yes
Representativeness		
Sampling appropriate for media and analytes	All sampling conducted in accordance with JBS&G procedures	Yes
Laboratory blanks	<LOR	Yes
Samples extracted and analysed within holding times.	All samples were extracted and analysed within holding times.	Yes
Trip spikes	78%-84%	Yes
Trip blanks	<LOR	Yes
Rinsate blank	Generally <LOR with the exception of zinc detected at the reporting limit	Partial[1]
Comparability		
Standard operating procedures used for sample collection & handling	Two JBS&G field scientists used standard operating procedures throughout works.	Yes
Standard analytical methods used	Standard analytical methods used, as detailed in the laboratory reports (**Appendix F**)	Yes
Consistent field conditions, sampling staff and laboratory analysis	Sampling was conducted by two field staff members using standard operating procedures in the same conditions throughout the works. The laboratories remained consistent throughout the investigation.	Yes
Limits of reporting appropriate and consistent	Limits of reporting were consistent and appropriate.	Yes
Completeness		
Soil description & Chains of Custody completed	All borehole logs and Chains of Custody were completed appropriately.	Yes
Appropriate documentation	All appropriate field documentation processes were undertaken. Borehole logs and Calibration/ Decontamination records are included as **Appendix I**.	Yes
Satisfactory frequency/result for QC samples	The QC results are considered adequate for the purposes of the investigation.	Yes

Data from critical samples is considered valid	Data from critical samples is considered valid.	Yes
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted site assessment criteria	Appropriate laboratory analysis methods and detection limits were considered to have been achieved during the field and laboratory phases of this investigation.	Yes

1. See discussion of DQI exceedances in **Section 7.2**.

G.2 QA/QC Discussion

G.2.1 Precision

Analytical results for the primary soil samples were within acceptable limits of agreement when compared with the blind duplicate samples for all analytes within all samples analysed. Analytical results for the primary soil samples were generally within the acceptable limits of agreement when compared with the split duplicate samples with the exception of the following:

- An RPD of 51 % was reported for arsenic between primary sample TP03 0-0.1 and split duplicate sample QC01A;
- An RPD of 58 % was reported for chromium between primary sample TP03 0-0.1 and split duplicate sample QC01A;
- An RPD of 34 % was reported for copper between primary sample TP03 0-0.1 and split duplicate sample QC01A;
- An RPD of 42 % was reported for zinc between primary sample TP03 0-0.1 and split duplicate sample QC01A; and
- An RPD of 46 % was reported for 4,4-DDE between primary sample TP03 0-0.1 and split duplicate sample QC03A.

The RPDs for the intra-laboratory and inter-laboratory duplicates and triplicates are presented in **Appendix H**. High RPDs are considered to be the result of heterogeneity in the soil samples collected. No analytical results from any of the analysed samples, including blind and split duplicates, were in excess of the adopted site criteria and therefore elevated RPDs results are not considered to influence the outcome of the investigation.

All laboratory duplicates returned RPDs within the acceptable limits.

On this basis the DQIs for precision are considered to have been achieved for this investigation.

G.2.2 Accuracy

Surrogate spike recoveries were generally within the acceptable range of 70-130%, with the exception of the following:

- 4-Bromofluorobenzene was under reported in 21 surrogate spike analyses with recoveries ranging from 50 % to 59 %. This analyte is a surrogate for BTEX compounds; given that all BTEX compounds were reported to be below the laboratory LOR and significantly (10x) below the adopted site criteria, this minor discrepancy is not considered to have negatively affected the reliability of the dataset for the intended purpose;
- Dibutylchlorendate was over reported in 12 surrogate spike analyses with recoveries ranging from 131 % to 149 %. This analyte is a surrogate for OCP compounds; given that all OCP compounds were reported significantly (10x) below the adopted site criteria, this minor discrepancy is not considered to have negatively affected the reliability of the dataset for the intended purpose;

- Tetrachloro-m-xylene was over reported in 2 surrogate spike analyses and under reported in 2 surrogate spike analyses with reported recoveries ranging from 51 % to 144 %. This analyte is a surrogate for OCP compounds; given that all OCP compounds were reported significantly (10x) below the adopted site criteria, this minor discrepancy is not considered to have negatively affected the reliability of the dataset for the intended purpose;

Laboratory control sample (LCS) recoveries were within the acceptable range of 70-130% and are considered acceptable.

Matrix spike recoveries were within the acceptable range of 70-130% and are considered acceptable.

On this basis the DQIs for accuracy are considered to have been achieved for this investigation.

G.2.3 Representativeness

The extraction and analysis of selected soil samples was completed within the recommended holding times for all analytes.

A rinsate sample was collected following decontamination of all non-disposable sampling equipment for the soil sampling event. Analyte concentrations in the rinsate blanks were generally below the laboratory limit of reporting (LOR), with the exception of nickel (0.001 mg/L in RINS 10/10/2016). It is considered likely that small particulates of soil which were not able to be removed from the hand trowel between each location and became dislodged during the rinsate procedure would have been washed into the sample container and returned a positive result when analysed. Given the lack of significant concentrations of zinc reported in any of the analysed samples, it is considered that possible cross-contamination as a result of ineffective implementation of decontamination procedures has not negatively affected the data set. Decontamination records are presented in **Appendix I**.

A trip spike was submitted with the soil samples collected during the assessment. Trip spike recoveries for analytes was within the acceptable limit of 70-130%.

A storage blank was submitted with the soil samples collected during the assessment. There were no reported concentrations of BTEX compounds above the laboratory LOR.

All laboratory blanks analysed reported analyte concentrations less than the laboratory LOR.

All field equipment was decontaminated appropriately as per the procedure identified in **Section E.2.3**. Collected samples were immediately placed into the sample containers, sealed and then placed into chilled eskies to minimise volatile loss.

Based on the above comments the DQIs for representativeness were considered to have been satisfactorily achieved.

G.2.4 Comparability

Eurofins, the primary laboratory, and Envirolab Services, the secondary laboratory, are NATA accredited for all analytical methods used. The laboratories used similar analytical methods and the analytical data were comparable between laboratories as indicated by the results of duplicate analysis. Where different LORs were adopted by the laboratories, this did not impact upon the usability of the data given that all values were considerably less than the adopted assessment criteria.

The samples collected for assessment purposes are considered comparable as all samples were collected by experienced JBS&G personnel in accordance with standard JBS&G sampling methods.

G.2.5 Completeness

All laboratory and field documentation is complete and correct. Chain of custody documentation is provided with laboratory reports in **Appendix F**. Bore hole logs are presented in **Appendix H**.

The frequency of analysis of all QA/QC samples was considered appropriate and valid.

G.2.6 Sensitivity

The adopted soil analytical methods provided suitable LORs with respect to the adopted site assessment criteria.

G.3 QA/QC Conclusions

The field sampling and handling procedures across the Site produced QA/QC results which indicate that soil data collected is of an acceptable quality.

The NATA certified laboratory reports indicate that the project laboratories were achieving levels of performance within its recommended control limits during the period when the samples from this program were analysed.

On the basis of the results of the field and laboratory QA/QC program, the soil data is of an acceptable quality upon which to draw conclusions regarding the environmental condition of the Site.

Appendix I Calibration and Decontamination Records

Field Equipment Calibration and Decontamination

JBS&G

PROJECT NAME: Caddens	**PROJECT NO:** 52116
FIELD DATES: 10/10/16	**FIELD STAFF:** RH/JS

CALIBRATION SUMMARY
EQUIPMENT: PID
CALIBRATION STANDARD: Iso butylene 100

DATE	TIME	READING (ppm_v)	COMMENTS
10/10/16	8:35	99.7	Calibration OK

DECONTAMINATION SUMMARY

EQUIPMENT: Hand trowel

1. Was the equipment decontaminated appropriately prior to sampling at each location?	(Y)	N	NA
2. Was excess soil removed by scraping, brushing or wiping with disposable towels?	(Y)	N	NA
3. Was the equipment contaminated with grease, tar or similar material? If so, was the equipment steam cleaned or rinsed with pesticide-grade acetone:hexane?	Y Y	N N	(NA)
4. Was phosphate-free detergent used to wash the equipment?	(Y)	N	NA
5. Was the equipment rinsed with clean water?	(Y)	N	NA
6. Was the equipment then rinsed with deionised water?	(Y)	N	NA
7. Were all sample containers cleaned and acid or solvent washed prior to sample collection?	(Y)	N	NA

WERE ANY ADDITIONAL DECONTAMINATION MEASURES REQUIRED? PROVIDE DETAILS.

Fresh pair of nitrile gloves used to collect each sample

Overview Summary
- Count of Samples
- Summary By Compound
- Count of Results

Holding Times
- Holding Time Errors (0)

Blanks
- Field Blanks
- Detects in Lab Blanks (0)
- SDG's without Storage Blanks (0)
- SDG's without Method Blanks (0)

Duplicates
- Field and Interlab Duplicates
- Lab Duplicates with high RPDs (0)
- Duplicate Samples with incorrect or missing Parent Samples (0)
- Samples at the same Location/Depth/Time not specified as duplicates (0)

Surrogates
- Surrogate Variation > 30% or outside lab LCL or UCL (39)

Lab Control Samples
- SDG's without a Laboratory Control Sample (0)
- Laboratory Control Samples, Error > 30% (0)

Certified and Standard Reference Materials
- Certified Reference Materials - Error > 30% (0)

Matrix Spikes
- SDG's without a Matrix Spike (0)
- Trip Spikes with invalid Control Sample (0)
- Less than 1 matrix spike in 20 samples, or less than 1 matrix duplicate in 20 samples (2)
- Matrix Spike Recoveries less than 70% or greater than 130% or outside lab LCL or UCL (0)
- Trip Spike Recoveries (70% - 130% is acceptable) (6)

Inorganic
- Na + CL > TDS (0)
- BOD > COD (0)
- BOD > COD (0)

Other
- Unit Conversion Problems (0)
- OriginalChemNames Requiring Validation (0)
- Samples with no Results (0)
- Samples associated with Wells which are not specified in the Well Table (0)
- Aborted Analysis (0)

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-20 x EQL); 30 (20-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory
