*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-20 x EQL); 30 (20-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

	Nonparametric UCL Statistics for Uncensored Full Data Sets	
User Selected Options		
Date/Time of Computation	6/29/2017 11:04:51 AM	
From File	WorkSheet.xls	
Full Precision	OFF	
Confidence Coefficient	95%	
Number of Bootstrap Operations	2000	

B(a)P (Green Spaces)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	3
		Number of Missing Observations	0
Minimum	0.5	Mean	0.567
Maximum	0.9	Median	0.5
SD	0.141	Std. Error of Mean	0.0471
Coefficient of Variation	0.25	Skewness	2.121
Mean of logged Data	-0.59	SD of logged Data	0.213

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	0.654	95% Adjusted-CLT UCL (Chen-1995)	0.68
		95% Modified-t UCL (Johnson-1978)	0.66

Nonparametric Distribution Free UCLs

95% CLT UCL	0.644	95% Jackknife UCL	0.654
95% Standard Bootstrap UCL	N/A	95% Bootstrap-t UCL	N/A
95% Hall's Bootstrap UCL	N/A	95% Percentile Bootstrap UCL	N/A
95% BCA Bootstrap UCL	N/A		
90% Chebyshev(Mean, Sd) UCL	0.708	95% Chebyshev(Mean, Sd) UCL	0.772
97.5% Chebyshev(Mean, Sd) UCL	0.861	99% Chebyshev(Mean, Sd) UCL	1.036

Suggested UCL to Use

95% Student's-t UCL	0.654	or 95% Modified-t UCL	0.66

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.
For additional insight the user may want to consult a statistician.

Gamma UCL Statistics for Uncensored Full Data Sets

Executive Summary

JBS&G Australia Pty Ltd (JBS&G) was engaged by Penrith City Council (Council, the client) to provide environmental consultancy services associated with the proposed redevelopment of land located at 114 to 146 Henry Street, 42 to 50 Station Street and the Allen Place Car Park, Penrith, NSW (the site). The site comprises ten legal properties and occupies a total area of approximately 1.87 hectares (ha), as shown in **Figure 1** and **2**.

Historical contamination assessments undertaken at the site have identified the potential for risks associated with the former operation of a dry-cleaner, at Shop 3 of 134-138 Henry Street, to current site occupants. In addition, it is understood Council intends on rezoning and divesting the site for redevelopment as part of the proposed Central Park Village. On this basis, data gaps pertaining to the contamination status of the site were identified and addressed through a targeted program of soil, groundwater, soil-vapour and indoor air assessment.

In accordance with the limitations in **Section 14**, the following conclusions are provided:

- Whilst not positively identified as part of this DGI, the potential remains for USTs to be present within the former service station at 118 Henry Street;
- Historical service station operations at 118 Henry Street have not resulted in gross/widespread contamination of site media. Localised, minor contamination hotspots may exist underlying the existing building footprint;
- Historical chlorinated solvent contamination at 134-138 Henry Street has resulted in contamination of site soils, groundwater and soil-vapour at the site;
- Cessation of dry-cleaning operations has resulted in removal of the primary VOC contamination source. Soils nearby to and underlying sewerage infrastructure servicing 134-138 and 140 Henry Street are considered likely to represent an ongoing secondary source of contamination to groundwater and soil-vapour;
- VOC impacted media at the site is localised to the vicinity of the former dry-cleaner. Impacted soil vapour and groundwater are migrating over the northern boundary of the site. The extent of impacted groundwater plume migrating northwest of JBMW05 has not been delineated;
- Results of indoor ambient air sampling undertaken at Shop 3/140 Henry Street have been variable, exceeding the adopted site investigation criterion in one round. On this basis, additional indoor air monitoring is required to determine whether contamination of onsite media represents a risk to current site users;
- An assessment of vapour intrusion potential undertaken within the basement at 121 Henry Street, Penrith has determined that, whilst highly elevated soil-vapour concentrations exist on the boundary of the Council property (Henry Road), no significant vapour intrusion into the basement is occurring;
- With consideration of the proposed general development scenario, potential risks to future site users. On this basis, the site will require remediation prior to, or concurrent with, site redevelopment activities; and
- Based on the results of the completed investigations completed it is considered that the site is able to be made suitable for the proposed future land uses subject to implementation of a RAP.

The following recommendations are provided:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Further groundwater and deep soil vapour assessment works are required the northwest of JBMW05 to provide a boundary to the plume extent.
- An interim EMP should be prepared for the site and should include ongoing monitoring of indoor air at Shop 3/140 Henry Street. In addition, the EMP should guide maintenance/construction activities which have the potential to involve disturbance of soils underlying current hardstands or building footprints and to control potential beneficial use of groundwater; and
- To address potential risks to future site users and potential risks to offsite receptors beyond the northern boundary, an RAP is required to be produced. The RAP should address existing data gaps pertaining to soils underlying existing buildings, offsite soil vapour impacts and the preferred remedial strategy for the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

1. Introduction and Background

JBS&G Australia Pty Ltd (JBS&G) was engaged by Penrith City Council (Council, the client) to provide environmental consultancy services associated with the proposed redevelopment of land located at 114 to 146 Henry Street, 42 to 50 Station Street and the Allen Place Car Park, Penrith, NSW (the site). The site comprises ten legal properties and occupies a total area of approximately 1.87 hectares (ha), as shown in **Figure 1** and **2**.

It is understood that Council intends on divesting the site for redevelopment as part of the proposed Central Park Village project. The redeveloped site will be utilised for a range of land uses including public recreation parklands, high density residential and commercial/retail. As part of the redevelopment Council requires that the land is rezoned from Commercial Core and Public Recreation to Mixed Use. The proposed future land uses are shown on **Figure 2**.

Previous environmental investigations at the site, documented in Geo-Logix (2016[1]), JBS&G (2017a[2]) and JBS&G (2017b[3]), have reported a range of contamination impacts. A Detailed Site Investigation (DSI) (JBS&G 2017a) concluded that the site was not currently considered suitable for the proposed land uses, but could be made suitable, subject to the implementation of a remedial action plan (RAP). Of primary concern, was a chlorinated ethene (CE) impact associated with a former dry-cleaning operation (Shop 3/134-138 Henry Street). Review of JBS&G (2017a) indicated that offsite migration of media contaminated by CEs is potentially occurring, north of the former dry-cleaner, along the inferred groundwater flow direction.

The reported concentrations of tetrachloroethene (PCE) and trichloroethene (TCE), in groundwater and soil vapour exceeded relevant investigation levels, indicating that there is a potential requirement for the site to be notified to the NSW Environmental Protection Authority (EPA) in accordance with the 'Guidelines on the Duty to Report Contamination Under the *Contaminated Land Management Act 1997 (CLM Act)'*, (NSW EPA 2015[4]).

Council notified the site to the EPA, providing copies of Geo-Logix (2016) and JBS&G (2017a) for review. The EPA determined that regulation of the CE contamination at the site under the CLM Act was not required. The response issued by the EPA indicated that assessment further assessment of the indoor air of premises connected to the former dry-cleaner by sewer should be undertaken.

Council engaged Rebeka Hall (The Auditor), a NSW EPA Auditor (No. 0802) accredited under the *Contaminated Land Management Act 1997* (CLM ACT), of Zoic Environmental Pty Ltd (Zoic) to conduct a review of the existing environmental investigations. The Auditor provided an Interim Advice (IA1), (Zoic 2017[5]), which identified the potential for contamination to exist at the site which has not been completely characterised by investigation works. With respect to the area of the former dry cleaning operations, IA1 reported the following potential contamination issues were not fully characterised:

- The nature and extent of the chlorinated hydrocarbon impact to groundwater and soil vapour, including the potential for offsite migration of contamination;

1 *'Preliminary Site Assessment Report, 134 – 138 Henry Street, Penrith NSW 2750'.* Geo-Logix Pty Ltd, Reference 1601069Rpt01FinalV01_12Aug16, 12 August 2016, Geo-Logix (2016);

2 *'Phase 2 Environmental Site Assessment – 114 to 146 Henry Street, 42 to 50 Station Street and Allen Place Car Park, Penrith, NSW*', JBS&G Australia Pty Ltd, Reference 52372/113034, 9 July 2017, JBS&G (2017);

3 *'Shop 3 Gaymark Lane, NSW, Human Health Risk Assessment'*, JBS&G Australia Pty ltd, Reference 52372-109468 Rev A, June 2017, JBS&G (2017b);

4 *'Duty to Report Contamination Under the Contaminated Land Management Act 1997*'. NSW Environment Protection Authority, September 2015, NSW EPA (2015);

5 *'Interim Advice 1 (IA1) – Review of Existing Information, City Park Precinct, Penrith NSW'*. Zoic Environmental Pty Ltd, Reference 17124 IA01 21Dec17.docx, Zoic (2017);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Impacts to groundwater as a result of historical site uses, including the former operation of a service station located at 118 Henry Street, Penrith, NSW (The Service Station); and
- The risk to occupants of Shop 3 of 140 Henry Street, Penrith, NSW under an ongoing commercial/industrial land use scenario.

This report incorporates a sampling, analysis and quality plan (SAQP) prepared by JBS&G (JBS&G 2018[6]), which documents data gaps that require addressing to allow characterisation of the risks posed and potential requirements for remediation associated with the former dry-cleaning operation. Based on the current use of the site, there were practical constraints on investigation strategies that would fully characterise the potential contamination. As such, Council has adopted a staged assessment strategy, whereby data gaps pertaining to the potential contamination issues which present the most significant financial risks to future developers are the subject of immediate investigation. It is an additional objective of Council to determine the risk to current occupants of buildings within the immediate vicinity of the CE source, under an ongoing commercial/industrial land use.

This report has been prepared concurrently with an assessment of the building basement located at 121 Henry Street, Penrith, NSW. The assessment was conducted to determine whether impacts migrating from the PCPV site potentially represent a risk to basement occupants, and is documented in JBS&G (2019[7])

This report documents the outcomes of the Data Gap Investigation (DGI) undertaken to address the data gaps reported in JBS&G (2018). The DGI has been developed such that it is consistent with the following NSW Environmental Protection Authority (EPA) made or endorsed guidelines: EPA (1995[8]), NEPC (2013[9]), OEH (2011[10]), EPA (2017[11]) and DUAP (1998[12]).

1.1 Objectives

The objective of this DGI is to characterise the following potential contamination issues:

- The nature and extent of impacts to mobile media in the area of the former dry-cleaning operations; and
- The potential risk to current occupants of 134-138 Henry Street and Shop 3/140 Henry Street due to the presence of CEs in soil vapour.

1.2 Scope of Works

The scope of work for this assessment is as follows:

- A review of publicly available site history and background information, as well as existing environmental site investigations, to identify potential areas of environmental concern (AECs) and associated contaminants of potential concern (COPCs);
- Acquisition of additional and/or updated site history and background information, including:

- Historical Development Application (DA)/Building Application (BA) records held or available to Council, accessed under the *Government Information (Public Access) Act 1989* as they relate to Shop 3/134-138 Henry Street and The Service Station;
- Publicly available heritage records held by the Department of Planning and Environment and Council;
- Records of environmental incidents, former environmental licences, or contaminated land notices or notifications, as held by the EPA;
- Licensed groundwater bores present within a 1.5 km radius of the site available on the online NSW Natural Resources Atlas; and

- Review of the environmental setting including a review of topography, geology, hydrogeology and meteorology of the Site and surrounding areas;
- Development and documentation of a conceptual site model (CSM) based on the available information;
- Determination of current data gaps precluding complete characterisation of the potential contamination issues at the site;
- Development and documentation of an SAQP with data quality objectives (DQOs) for the DGI in general accordance with relevant EPA guidelines;
- Execution of a field investigation program comprising sampling of soil, soil-vapour, groundwater and indoor air, at relevant locations across the site;
- Analysis of selected samples for a range of COPCs as identified within the SAQP (JBS&G 2018);
- Comparison of collected data against regulator published / endorsed investigation criteria to facilitate an assessment of land use suitability; and
- Preparation of this DGI report in general accordance with relevant EPA guidelines.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2. Site Condition and Surrounding Environment

2.1 Site Identification

The site location is shown on **Figure 1**. The extent of the site and associated cadastral boundaries are shown on **Figure 2**. The site details are summarised in **Table 2.1** and described in detail in the following sections.

Table 2.1 Summary Site Details

Property Identification and Street Addresses	The site is comprised of the following legal properties: • Lot 1 in DP 545587 – 114 to 116 Henry Street; • Lot 1 in DP113118 – 118 to 120 Henry Street; • Lot 1 in DP 254763 – Henry Street; • Lot 1 in DP 164798 – 134 to 138 Henry Street; • Lot 10 and 11 in DP 553665 – 142 Henry Street; • Lot 2 in DP 556075 – 144 Henry Street; • Lot 3 in DP1200790 – 42 to 44 Station Street; • Lot 1 in DP 526304 – 48 to 50 Station Street; • DP 163176 (No Lot #) – 46 Station Street; In addition, the site area includes the Allen Place Car Park, Gaymark Lane and Allen Place.
Local Government Authority	Penrith City Council
Approximate MGA Coordinates (MGA 56)	As shown on **Figure 2**
Site Zoning	Commercial Core (B3) and Public Recreation (RE1), Penrith (2010[13])
Current Use	Commercial precinct
Previous Use	Commercial precinct and residential, including former dry-cleaning and former petroleum storage/dispensing
Proposed Use	Low density residential
Site Area	Approximately 1.87 ha

2.2 Site Description

The following site description has been adapted from the DSI and updated based on a site inspection undertaken on 8 February 2018. Additional details, pertaining to two shops assessed for indoor air quality, have been included. A photographic log is presented in **Appendix A.**

The site is an irregularly shaped, large commercial precinct bound by the Allen Place loop, Henry Street, Station Street and 98-100 Henry Street. It is comprised of the Allen Place car park and ten commercial premises on the southern side of Henry Street in Penrith. The borders of the site were not secured and open to the public (pedestrians and vehicles). The site was utilised for a range of commercial operations at the time of the site investigation including a car park, retail shops and cafes. High pedestrian and vehicular traffic was observed during working hours.

During the current site assessment period, 8 February to 3 May 2018, all commercial premises at the site were noted to be occupied, including Shop 3/134-138 Henry Street and Shop 3/140 Henry Street.

The site generally sloped downward from east to west, with a slight ridge line observed to dissect the centre of the car park. Inspection of site surfaces and comparisons with the surrounding landscape indicated that significant topographical alterations had not occurred.

Approximately 95 % of the ground surfaces were sealed as asphaltic pavement, concrete pathways, and building footprints with onsite drainage channels directing surface water toward the municipal stormwater system. The balance of the site comprised unsealed grounds in the form of garden beds.

[13] *'Penrith Local Environmental Plan 2011'*, Penrith City Council, 11 August 2017, Penrith (2010);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Buildings at the site did not exhibit significant indicators of dilapidation, although minor wear, consistent with the age of the buildings was observed. A detailed inspection/hazardous building materials survey of the existing site structures was not undertaken as part of this investigation.

No surface water was present at the site at the time of the investigation. No evidence of waste storage, with the exception of commercial municipal waste bins, or storage tanks was observed at the site. No olfactory indicators of volatile chemical usage, as described in the DSI, were encountered during the recent site inspection. No visual indicators of gross or widespread contamination were observed.

Four transformers were observed: one in the southwest and east corners of the Site and two along the northern boundary of the Allen Place Car Park, which were on raised concrete platforms. No hydrocarbon staining was observed to be associated with the transformers. The location of the transformers is shown on **Figure 2.**

2.2.1 Shop 3/134-138 Henry Street, Penrith

The ground floor of 134-138 Henry Street was is divided into three separate shops. The southernmost (Shop 1) was a café, the centre (Shop 2) and northernmost (Shop 3) were retail stores. All three premises are serviced by the same sewerage line, connecting to the broader node (**Figure 4D**).

The former dry cleaner comprised the northern third (Shop 3) of the building located at 134-138 Henry Street, Penrith. The shop-front occupied the majority of the building footprint (>85 %), with the remainder comprising a secluded water closet, storage space and point of sale. The premise was an operational scooter store, occupied by scooters, bikes, helmets and related paraphernalia.

The water closet comprised a small (<3 m^2), fully enclosed space which was serviced by two separate sewerage disposal points. Detergents, household solvents and soaps were observed to be stored within the water closet. The shop-front was serviced by an air exchange (air-conditioning) unit which was observed to be operational during each visit to the premises.

In the alleyway between Shop 3/134-138 Henry Street and Shop 3/140 Henry Street, numerous services were present. Sewerage infrastructure and stormwater pipes ran in a north to south orientation, connecting stormwater and sewerage pipes to the greater system, south of the premises. Services were noted to comprise a mixture of terracotta and polyvinyl chloride pipes.

2.2.2 Shop 3/140 Henry Street, Penrith

The premises comprised the southern half of the building located at 140 Henry Street, Penrith. The shop was partitioned into four rooms and a water closet, joined by a central hallway. The premises housed an alternative health centre at the time of the investigation.

The shop-front rooms were serviced by air exchange units (air conditioners) which were observed to be in operation during each site visit. The water closet comprised a small (<5 m^2), fully enclosed space which was serviced by two separate sewerage disposal points.

An inspection of the property revealed an extensive repertoire of household cleaning and medical products: limescale solvents, surface cleaners, stain removers, methylated spirits, polishes, pest control products, ethanol based surface wipes and carpet deodorizers. In addition, discussion with the current tenants indicated that they often burn incense and candles.

2.3 Surrounding Land Use

The current land uses of adjacent properties or properties across adjacent roads are summarised below.

- North – The site was bound to the north by Henry Street and then numerous commercial premises including Fit'n'Fast Penrith, Queens of Hearts Community Foundation and Nepean College. Further north was an open carpark and commercial premises on Belmore Street,

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

including Bob Jane T-Marts and Veterinary Hospital.

The building located at 121 Henry Street, Penrith comprised a commercial/government office building which was observed to include a multi-level basement carpark;

- East – To the east of the site was Woodriff Street North, followed by by commercial premises and Edwards Place carpark. Further east a Pathology Centre and testing laboratory existed;
- South – The site was bound to the south by Allen Place, following which are multiple commercial properties including cafes, a medical centre and pharmacy. Beyond High Street commercial premises were present; and
- West – The site was bound to the west by Station Street, then medium to high density commercial premises. Further to the west was Peach Tree Creek and eventually the Nepean River.

2.4 Topography

Review of topographic information obtained from the Spatial Information Exchange Viewer, LPI (2015[14]) regional topographic map indicated that the site surfaces have an elevation of approximately 30 m Australian Height Datum (AHD). The site generally sloped downwards to the west, towards the Nepean River.

Site inspection confirmed that the topography on site was not significantly altered from the natural alignment and sloped slightly downward toward the western boundary, Station Street. A local ridge line existed which dissected the Allen Place Car Park in an approximately west to east alignment, with site surfaces sloping downwards perpendicular to the ridge line.

2.5 Geology and Soils

Reference to the 1:100 000 Geological Series Sheet for Penrith, DMR (1991[15]) indicates that the site is underlain by Bringelly Shale of the Wianamatta Group originating from the Middle Triassic epoch. This unit is comprised of shale, carbonaceous claystone, claystone, laminite, fine to medium-grained lithic sandstone, rare coal and tuff. Bringelly Shale is underlain by Ashfield Shale and, at depth, Hawkesbury Sandstone.

Reference to the 1:100 000 Soil Landscape Series Sheet for Penrith, DMR (1990[16]) indicates that the site is within the Richmond Soil Landscape group. This group of landscape is characterised by quaternary terraces of the Nepean and Georges Rivers. Relatively flat (slopes <1 %) and level. Splays, levees provide local relief of <3 m. Formerly a low open woodland. Richmond soils are poorly structured orange to red clay loams, clays and sands. Texture may increase with depth. Ironstone nodules may be present. Plastic clays in drainage lines, red earths and red podzolic soils occur on terrace surfaces with earthy sands on terrace edges. Limitations of the Richmond group include high erosion hazard on terrace edges and minor localised flooding.

The lithology observed during groundwater well installation undertaken as part of the DSI, JBS&G (2017a) was reported as follows:

- Shallow to moderately deep alluvial soils comprising clay to sandy clay (present from a depth of 0.4 m to 10.5 m below ground surface (bgs));
- Moderately deep to deep clay to sandy clay mixed with Nepean River gravels (present from a depth of 6.1 m to 13.0 m bgs); then

[14] *'Spatial Information Exchange Viewer'*, NSW Land and Property Information, Accessed 4 January 2018, https://maps.six.nsw.gov.au/;
[15] *'Penrith 1:100 000 Geological Series Sheet 9030 (Edition 1)'.* Department of Mineral Resources, 1991, DMR (1991);
[16] *'Penrith 1:100 000 Soil Landscape Series Sheet 9030'*. Department of Mineral resources, 1990, DMR (1990);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Residual shale bedrock (present from a depth of 13.0 m to 15.0 m bgs).

2.6 Salinity

Reference to the Department of Infrastructure, Planning and Natural Resources salinity potential map GS912, DIPNR (2002[17]), has indicated that the site exists within an area of 'moderate salinity potential'.

Areas on Wianamatta Group Shales and tertiary Alluvial Terraces. Scattered areas of scalding and indicator vegetation have been noted but no concentrations have been mapped. Saline areas may occur in this zone which have not been identified or may occur if risk factors change adversely. Vegetation at the site observed during the site inspection did not exhibit any indicators of salinity related stress.

2.7 Hydrology

Rainfall is considered likely to migrate primarily through surface water runoff into the municipal stormwater system. Minor infiltration into the underlying porous soils and surface is also expected in areas of unsealed ground.

As discussed in **Section 2.2**, the site is largely covered by concrete, asphaltic pavements and building footprints. As such, surface water generated during periods of rainfall is anticipated to primarily enter the municipal stormwater system; via discharge into onsite stormwater catchment infrastructure or alternatively discharge into stormwater pits within the surrounding roadways.

The nearest water body to the Site is Peach Tree Creek, approximately 1.1 km to the west of the site boundary. Peach Tree Creek ultimately contributes to the Nepean River. Municipal stormwater discharges to the Nepean River.

2.8 Hydrogeology

Registered groundwater bore information was obtained from the NSW Department of Primary Industries groundwater mapping tools, NSW DPI (2016[18]) (**Appendix B**). A review of the registered bore information indicated that there were thirteen bores within a 1.5 km radius of the Site. The registered bore searches are summarised in **Table 2.2**.

Table 2.2 Registered Groundwater Bore Search

Bore ID	Use	Property	Standing Water Level (m bgs)	Well Depth (m)	Encountered Geology Comments
GW026231	Recreation	N/A	-	8.53	Shallow silt and loam clay (4.26 m bgs) to river gravels (4.26-8.53 m bgs)
GW029710	Domestic	N/A	6.00	7.92	Shallow loam (0-2.74 m bgs) to river gravels (2.74-7.92 m bgs)
GW101178	Test Bore	N/A	8.00	11.20	Shallow sandy clay and grey sands (0-6.00 m bgs) to coarse river gravel and cobbles (6.00-10.50 m bgs) overlying residual shale.
GW103048	Recreation	Penrith Showground	6.00	8.00	-
GW108041	Monitoring	Coreen Ave Penrith	6.70	7.50	Shallow clay (0.20-3.30 m bgs) overlying river gravels (3.30-7.50 m bgs)
GW108042	Monitoring	Coreen Ave Penrith	6.40	8.00	Shallow clay (0.20-2.50 m bgs) overlying river gravels (2.50-7.50 m bgs)
GW108043	Monitoring	Coreen Ave Penrith	6.80	9.00	Shallow clayey sands (0.20-5.40 m bgs) overlying river ravels (5.40-9.00 m bgs)

[17] *'Salinity Potential In Western Sydney 2002 – GS912'*. Department of Infrastructure, Planning and Natural Resources, March 2003, DIPNR (2002);

[18] NSW Department of Primary Industries, 2015. Groundwater Monitoring Overview Map. Http://allwaterdata.water.nsw.gov.au/water.stm. Accessed 8 November 2016;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Bore ID	Use	Property	Standing Water Level (m bgs)	Well Depth (m)	Encountered Geology Comments
GW108044	Monitoring	Coreen Ave Penrith	6.60	9.50	Shallow fill and silty clayey sands (0.00-6.40 m bgs) overlying river gravels (6.40-9.50 m bgs)
GW108484	Recreation	Station St Penrith	-	11.00	Shallow clay (0-6.00 m bgs) to sand (6.00-8.50 mbgs) overlying river gravels (8.50-11.00 m bgs)
GW111987	Monitoring	High St Penrith	-	9.00	Shallow clay (0-3.00 m bgs) overlying river gravels (3.00-9.00 m bgs)
GW111988	Monitoring	High St Penrith	7.50	9.00	Shallow clay (0-3.00 m bgs) overlying river gravels (3.00-9.00 m bgs)
GW111989	Monitoring	High St Penrith	7.50	9.00	Shallow clay (0-3.00 m bgs) overlying river gravels (3.00-9.00 m bgs)

Based on the reported geology, topography and depth to groundwater, groundwater migration is expected to occur in a north-westerly direction, towards Peach Tree Creek approximately 1.2 km away. Groundwater has been reported in the surrounding properties within the river gravels layer. A relatively high-water table (between 5 m and 10 m bgs) is anticipated given the reported levels in the surrounding groundwater wells and the lack of significant variation in topographic levels. The DSI reported groundwater depths ranging from 6.96 m to 8.05 m bgs, flowing in a north-westerly direction.

Registered groundwater bores located within a 1.5 km radius of the site are used for monitoring, recreational and testing purposes. Given the relatively dense urban use of the site and surrounding properties, in addition to the identified licensed bores, there is a moderate probability of additional undocumented monitoring/irrigation bores near the site. No reported utilisation of groundwater as a drinking water source has been reported.

2.9 Acid Sulfate Soils

The Guidelines for the Use of Acid Sulfate Soil Risk Maps, Department of Land and Water Conservation (DLWC) (1997[19]), has indicated that acid sulfate soils (ASS) are likely to be located in coastal lowlands up to about 10 m AHD. No risk map for the area encompassing the site was provided as part of the acid sulfate soil risk map series, DLWC (1998). Review of the geographical and topographical location of the site has indicated that it is a significant distance away from tidal creeks or estuaries, and it is considered unlikely that ASS would exist at the site.

Three Section 149(2&5) planning certificates were obtained for the site, provided in the DSI. The land was not identified to have been affected by a policy adopted by Council or adopted by any other public authority, notified to Council, that restricts the development of the land because of the likelihood of ASS.

No staining, odours or other indicators of ASS were observed during the DSI. No further consideration of the potential presence of ASSs was necessary for the purposes of this investigation.

2.10 Meteorology

A review of average climatic data for the nearest Bureau of Meteorology monitoring location (Penrith Lakes[20]) indicates the site is located within the following meteorological setting:

- Average minimum temperatures vary from 5.5 ^{o}C in July to 18.5 ^{o}C in January;
- Average maximum temperatures vary from 17.7 ^{o}C in July to 30.7 ^{o}C in January;

[19] '*Guidelines for the use of Acid Sulfate Soil Risk Maps, Edition 2*', 1998, Ref: ISBN 0 7347 5134 6, NSW DLWC (1998);

[20] http://www.bom.gov.au/climate/averages/tables/cw_067113.shtml, Commonwealth of Australia, 2013 Bureau of Meteorology, Product IDCJCM0028 prepared on 1 November 2016 and accessed by JBS&G on 8 November 2016

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- The average annual rainfall is approximately 728.1 mm with rainfall greater than 1 mm occurring on an average of 71.7 days per year; and
- Monthly rainfall varies from 30.6 mm in September to 121.4 mm in June with the wettest periods occurring on average in January to June.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Site History

A comprehensive review of the site history is provided in JBS&G (2017a). Readily accessible resources have been reviewed and updates to the site history are provided below. As part of the DGI, additional site history information has been reviewed and pertinent details are provided below.

3.1 EPA Records

A search of the NSW EPA database was undertaken on 12 February 2017 (**Appendix C**) for the site and immediate surroundings. The search consisted of the:

- NSW EPA Protection of the Environment Act public register of licence, applications and notices (maintained under Section 308 of the *Protection of the Environment Operations Act 1997* (POEO Act));
- NSW EPA contaminated land public register of record of notices (under Section 58 of the *Contaminated Land Management Act 1997* (CLM Act)); and
- NSW contaminated sites notified to the EPA (under Section 60 of the CLM Act).

No prevention, clean-up or prohibitions notices and no transfer, variation, suspension, surrender or revocation of an environment protection licences has been issued under the POEO Act for the Site and immediate surroundings.

No notices have been issued under the CLM Act for the Site and immediate surroundings.

Shop 3/134-138 Henry Street is on the list of NSW contaminated sites notified to the EPA, currently classed as 'Under Assessment'.

3.2 Heritage

An updated search of the Australian Heritage Trust database did not reveal any heritage listed items at the site or its immediate surrounds. Heritage information covers Aboriginal as well as European heritage. A search of the NSW Heritage Inventory did not reveal any heritage listed items at the site or immediate surrounds.

Both Australian Heritage Trust and NSW Heritage information are included in **Appendix D**.

3.3 Review of Council DA / BA Records

3.3.1 134-138 Henry Street

Information relating to the operational layout of Shop 3/134-138 Henry Street, included in Geo-logix (2016), is provided in **Appendix E**. An application for sewerage service diagrams servicing Shop 3/134-138 Henry Street was sent to Sydney Water Corporation on 16 January 2018. The sewerage service diagrams are provided in **Appendix E** and shown on **Figure 3.**

Based on this information, it is apparent that the components of the dry-cleaning infrastructure which present the most significant risk for the release of COPCs to the environment were limited to the southern portion of the portion of the building occupied by Shop 3/134-138 Henry Street. Sewerage infrastructure is noted to service the southwest portion of the Shop 3/134-138 Henry Street, directing effluent south to the adjoining mains.

3.3.2 The Service Station

Information relating to the operational layout of The Service Station (118 Henry Street) identified during review of the Council Development Application / Building Application (DA / BA) records, is provided in **Appendix E**. No information existed within the relevant Council records documenting the location of USTs at the former service station. Based on the information provided, bowsers were present on the western and northern portions of the site, indicating that USTs were likely to have been present in these portions of the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.3.3 98 to 100 Henry Street

Based on anecdotal information provided by the Site Auditor, a comprehensive review of DA/BA records pertaining to the properties located at 98 to 100 Henry Street were reviewed. Commercial uses of the premises were noted to be limited to retail, health, restaurants, grocery stores and chemists.

Significantly contaminating land uses (such as dry cleaners) were not identified during the period the properties were used for commercial purposes.

3.3.4 121 Henry Street

Inspection of the properties surrounding the PCPV identified a building on the property located at 121 Henry Street, underlain by a basement. Given the proximity of the property to impacted groundwater on the site, DA records were sought from Council to determine whether a risk to current occupants may be present (**Appendix E**).

Plans for the building, submitted with the DA for alterations to the external building structures, including construction of new level 2 office areas, were identified and reviewed. The plans indicate that the building includes a two-level basement with a split level surrounding the building core lifts and services. The basement design indicates that the lower basement level terminates at a depth of approximately 22 m AHD (5 m below Henry Street level) within the southern extent. The first level basement is shown as terminating at approximately 25.5 m AHD (~1.5 m below Henry Street level).Considering measured water levels on the PCPV and the design level for the lower basement slab at 121 henry Street it is considered that groundwater is approximately 1-2 m below the lower level carpark.

3.4 Summary of Site History

The site has been used for a range of uses over its occupied history. Aerial photographs indicate that the site was used primarily for residential housing until the mid-1960s. It underwent staged redevelopment through the 1960s and 1970s until its arrangement was largely in alignment with the current site layout, as observed during the site inspection.

Land title records and aerial photographs indicate that the property located at 118 Henry Street (The Service Station) operated as a service station for a brief period (<10 years) between 1967 and 1977. The site inspection, previous environmental investigations and land title records indicate that the dry cleaner operated from 1977 until late 2017.

Except for the dry cleaner and The Service Station, historical site uses for commercial purposes appear to have been limited to low impact commercial (retail and restaurant) type activities.

No hazardous goods storage licences were identified to have been issued for the site. Based on the range of sources and the general consistency of the historical information, it is considered that the historical assessment has an acceptable level of accuracy with respect to the potentially contaminating activities historically occurring at the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Previous Environmental Investigations

4.1 Preliminary Environmental Site Assessment Report, Geo-Logix (2016)

Council engaged Geo-Logix Pty Ltd (Geo-Logix) to conduct a preliminary ESA, Geo-Logix (2016) at the property located at 134-138 Henry Street, Penrith, NSW (the preliminary assessment area, Lot 1 DP164798, **Figure 2**). The preliminary assessment was undertaken to assess the potential for contamination to exist at the site given the presence of Shop 3/134-138 Henry Street within the preliminary assessment area.

The preliminary ESA indicated that the site appeared to be vacant until the 1950s. In the period intervening construction of the current building layout and its former vacant use, the site was used for storage of materials. The building layout as observed in the current investigation was constructed during the 1960s and the dry cleaner has operated since 1977. Additionally, aerial photographs provided as part of the report indicated that a service station operated from the 1950s to the 1970s (The Service Station, Lot 1 DP113118, **Figure 2**) which was considered to potentially comprise an off-site contamination source for the preliminary assessment area (134-138 Henry Street). It is noted that the historical service station area forms part of the current investigation area.

Geo-Logix carried out passive soil vapour assessments at two locations within the dry-cleaning shop. Chlorinated ethenes (CEs) PCE, TCE and DCE were detected in soil vapour samples at concentrations in exceedance of the commercial land-use criteria adopted for the assessment. Additionally, benzene, toluene, ethylbenzene and xylene (BTEX) compounds were detected within the soil vapour at concentrations above the laboratory limit of reporting (LOR) but below the commercial land use criteria. Geo-Logix did not identify onsite migration of contaminants from the former service station as a likely source for these BTEX compounds. The preliminary ESA report identified the presence of potential asbestos containing materials (ACM) forming part of the construction of building within the assessment area.

It is JBS&G's experience that soil vapour generated via passive soil vapour measurements are generally unreliable and cannot be supported by sufficient quality assurance/quality control (QA/QC). As such, results from the assessment have not been considered as part of the current investigation.

The site was notified to the EPA by Council following the works undertaken by Geo-Logix. In the period intervening collection of desktop search data for the DSI and the current investigation, the preliminary assessment area was listed on the List of Contaminated Sites Notified to the EPA. An updated copy of the list is provided in **Appendix C**. The EPA provided a response to Council on 12 March 2018, subsequent to review of Geo-Logix (2016) and JBS&G (2017a)

4.1.1 Phase 2 Environmental Site Assessment, JBS&G (2017a)

4.1.2 Introduction

JBS&G was engaged by Council to undertake a DSI at the site. The objective of the DSI was to determine potential for contamination based on current and historical site activities and to draw conclusions regarding the potential contamination status of the site for the proposed land uses, or make recommendations to enable such conclusions to be made. Consideration was given to the potential for contamination to represent unacceptable risks to future site users based on future land uses proposed under the Central Park Village redevelopment.

The assessment comprised a review of Geo-Logix (2016), the site's environmental setting and historical site activities in conjunction with a multi-faceted field investigation. The field program included inspection, sampling and analysis of soil samples from 28 borehole locations, 3 groundwater samples from monitoring well installed as part of the program and 10 soil vapour samples collected from sub-slab soil vapour probes. The sampling locations undertaken as part of

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

the DSI, including exceedances of the relevant criteria are shown on **Figure 4A** to **4C.** JBS&G indicated that the presence of buildings and occupied tenancies during the investigation precluded detailed assessment of all site areas.

The site history assessment indicated that the site has been used for a combination of residential and commercial purposes over the period of available records. Historical land title records, obtained for three of the legal properties, indicated that the premises were owned for residential purposes, prior to light commercial use (retail, service station and funeral home facilities). The site was identified to have undergone numerous redevelopments comprising demolition of former structures. Geo-Logics (2016) was reviewed as part of the site history investigation, which indicated the former dry-cleaning operation was a potential source of contamination.

The desktop assessment identified a range of COPCs associated with the following AECs:

- The dry cleaner (Shop 3/134-138 Henry Street, **Figure 2**): improper disposal of dry cleaning chemicals resultant from the operation of the dry cleaner;
- The Service Station (118 Henry Street, **Figure 2**): improper management of petroleum hydrocarbons associated with the operation of the former service station;
- Whole of Site**:** impacts to potential imported fill materials and disturbed/reworked natural materials:
    - Fill materials of unknown origins observed to be present due to site development activities;
    - Pesticide and herbicide application associated with onsite residential maintenance activities within surficial-moderately deep fill and natural soils;
    - Fuel and oil spills associated with onsite residential maintenance activities; and
    - Hazardous building materials associated with existing and former site structures.

4.1.3 Intrusive Investigation Activities

JBS&G advanced 20 boreholes on a systematic grid and an additional 8 boreholes to target AECs identified as part of the desktop assessment. Selected soil samples were submitted to Eurofins MGT (Eurofins) for laboratory analysis based off characteristics observed during sample collection. COPCs were analysed at the following rates: 35 samples for heavy metals (arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni) and zinc (Zn)); 15 samples for volatile organic compounds (VOCs); 20 samples for total recoverable hydrocarbons (TRHs), polycyclic aromatic hydrocarbons (PAHs), phenols and asbestos (500 mL); 24 samples BTEX; and 9 samples for polychlorinated biphenyls (PCBs) and organochlorine pesticides (OCPs).

Three groundwater wells were installed, which were later developed and sampled. The groundwater well installation logs are provided as **Appendix F**. The groundwater samples were analysed for heavy metals, VOCs, TRHs and low-level PAHs.

JBS&G installed 10 sub-slab soil vapour probes surrounding Shop 3/134-138 Henry Street. The sub-slab soil vapour probes were used to access shallow soil vapour. Soil vapour was sampled via active extraction of soil vapours and sorption of VOCs to laboratory prepared carbon tubes. All ten samples were analysed for the presence of VOCs and three samples within the vicinity of the former service station were analysed for TRHs.

4.1.4 Results of the Assessment

Underlying hardstand pavements, fill materials were encountered to depths ranging from 0.2 m and 2.0 m bgs. Fill comprised a combination of silts and clays with varying sand content. Colours were observed to be primarily brown and grey with some orange/yellow clays also encountered. Anthropogenic inclusions were observed within fill material from some locations. Three distinct

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

natural materials were encountered during the investigation: silty/sandy clay which exhibited increasing (although still minor <10 %) sand content with depth (0.2 m – 10.5 m bgs), Nepean River gravels (6.1 m – 13.0 m bgs) and shale bedrock (>11.7 m bgs). No ACM, odours or staining were observed on site surfaces or within the soil profile at any investigation location. No PID readings >1 ppm were reported during field screening for volatile organic compounds during soil sampling.

Sample results from the soil vapour sampling and analyses indicated that CE impacts are present within the vicinity of the dry cleaner. Volatile gas impact extends north of the dry cleaner, along the inferred groundwater flow direction, with exceedances of the soil vapour criteria for PCE and TCE identified from gas samples taken at probe locations SV05 and SV10 (**Figure 4C**). It is noted that the most significant concentrations were detected at location SV05, approximately in line with the inferred groundwater flow direction, and that no exceedances of the site investigation criteria were reported east or south of the dry cleaner.

Contaminants in soils and groundwater were generally not present at concentrations representing statistically significant exceedances of the site assessment criteria with the exception of the following:

- Lead in soil was detected at 930 mg/kg in a sample of fill material from one of the borehole locations. Photographs presented in the DSI indicate that shallow material at this location was impacted by blast furnace slag. This sample was the only sample with statistically significant exceedances of the adopted site criteria, and it is noted that the balance of fill samples analysed were reported to have concentrations below the site investigation criteria. The high concentration of lead in this sample is considered likely to be associated with the observed slag; and
- Concentrations of PCE (0.059 mg/L) and toluene (0.094 mg/L) in groundwater, collected from location PSM01, were present at concentrations exceeding the adopted drinking water criteria, which was considered to represent a potential unacceptable risk to future onsite receptors;

In addition to the above, exceedances of the laboratory LOR for TRHs were reported in groundwater samples from each well, the source for which is unclear. The concentrations were not considered representative of a risk to future onsite/offsite receptors. Additional works are required to determine the source of elevated TRHs.

Groundwater and soil concentrations within the vicinity of the dry cleaner also indicated the presence of CEs, primarily PCE and TCE, albeit at concentrations which were below the adopted site assessment criteria. With respect to the position of the dry cleaner, the inferred groundwater flow direction and the sewer diagrams provided in **Appendix E**, the presence of elevated PCE and TCE within the groundwater sample from PSM01 indicates that CEs may have migrated along the sewerage infrastructure prior to their release into the environment.

4.1.5 Conclusions

JBS&G provided the following conclusions:

- The soil vapour impact underlying, and extending to the north and west of, the dry cleaner represents a potential risk to current and future site users which will require management prior to utilisation of the site for the proposed land uses;
- There is the potential that offsite migration of CEs is occurring via soil vapour and groundwater, along the inferred groundwater flow direction north-northwest of the site boundary;
- Lead impacted fill material will require management prior to use of the site for the proposed land uses. The lead impacted fill material is considered to be limited to soils with slag inclusions.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Additional asbestos may be present within fill materials which were not detected via analytical sampling undertaken as part of the DSI;
- With the exception of the aforementioned, contaminants concentrations in soil and groundwater were generally not representative of significant exceedances of the site assessment criteria, and were not considered to represent a risk to current/future site uses;
- No background soil or aesthetic impacts were identified;
- The site was considered unsuitable for the proposed land uses; however, it was considered that the site could be made suitable for the proposed land uses subject to implementation of a Remedial Action Plan (RAP) which guided the remediation of the identified impacts; and
- The reported concentrations of CEs in groundwater/soil vapour exceed the relevant investigation levels presented in Schedule B1 of NEPC (2013). As a result, there is a potential requirement for the site to be notified to the NSW EPA in accordance with the Guidelines on the *Duty to Report Contamination under the Contaminated Land Management Act 1997,* NSW EPA (2015).

4.2 Shop 3 Gaymark Lane, Penrith, NSW – Human Health Risk Assessment, JBS&G (2017b)

JBS&G was engaged by Council to provide an assessment of the potential human health risk to future commercial occupants of the building described as Shop 3 Gaymark Lane, as located on the southern portion of Shop 3/140 Henry Street. The premises is located within the extent of the site subject to the current investigation.

The Human Health Risk Assessment (HHRA) was considered warranted based upon a review of environmental data provided in JBS&G (2017a), to determine whether soil, groundwater and/or soil vapour impact reported in JBS&G (2017a) posed an unacceptable risk to a proposed future use of the premises for commercial purposes. This has been interpreted as consisting of occupation of the building for commercial activity/durations by adults to assess the risk posed to future occupants of the premises.

The risk assessment considered maximum levels of TCE and PCE recorded in soil vapour in proximity of the premises, and the levels reported adjoining the premises. A sensitivity analysis was undertaken with the risk assessment which has found that the estimated levels of risk were considered suitable conservative to premise decision making in relation to objectives stated.

The levels of sub-surface impact were reported to not pose an unacceptable health risk to potential future commercial users of the site. JBS&G stated that there was no potential for aesthetic impacts through recognition of odours associated with the site impact.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5. Data Gaps

Data gaps identified during review of the existing environmental investigations are presented in **Section 5.1** to **Section 5.4** below. The data gaps have formed the basis of the scope of work undertaken in this assessment.

5.1 Chlorinated Ethene Impact Characteristics

Historical investigation works have identified a CE impact to soil, groundwater and soil vapour in the vicinity of the dry cleaner. Results presented in the DSI have indicated that the CE impact may be migrating west of the dry cleaner and off-site via the northern boundary, within mobile media (groundwater and soil-vapour). In addition, CEs may have migrated through/along the sewerage infrastructure shown on **Figure 3.**

No sampling has occurred to date along/across the northern boundary of the site to assess the potential for offsite migration of mobile media. No groundwater or soil vapour sampling has been undertaken west of historical sample locations identified to be significantly impacted (SV05 and PSM01). In addition, delineation of the extent of CE impacts to soil identified in fill/natural soils collected from JHA04 (**Figure 4A**) has not been undertaken.

5.2 The Service Station

Operation of The Service Station located at 118 Henry Street may have resulted in impacts to soil, groundwater and soil-vapour which have not yet been characterised. Additional groundwater characterisation activities are required to be undertaken downgradient of The Service Station to determine if contamination of the groundwater has occurred as a result of The Service Station's operation.

DA design documentation associated with the former service station has been provided in **Appendix E**. It is noted that a review of Council DA documentation did not provide any indication of the location of former/current underground petroleum storage systems.

5.3 Onsite Indoor Air Quality

The soil vapour assessment undertaken as part of JBS&G (2017a) included a single soil vapour sampling event. Given the presence of elevated contaminant concentrations in soil-vapour, The Auditor requested that additional sampling events be considered to characterise soil vapour concentrations. Soil vapour sampling events are used as the basis to inform potential levels of volatile constituents in indoor air, and in lieu of being able to undertake additional soil vapour measurements, an assessment instead can be undertaken of indoor air.

No indoor air sampling has been undertaken. Given the absence of indoor air sampling data, and the potential limited extent of the soil vapour locations able to be assessed, it is not possible to clearly define potential risks in onsite buildings within the vicinity of the CE impact.

5.4 General Site Characterisation

Broad scale characterisation activities undertaken at the site have been limited due to the presence of extensive building footprints and the current occupational status of the site.

Additional groundwater assessment activities are required to determine the groundwater flow direction and potential impacts associated with the former site uses (the dry cleaner and The Service Station) identified during the desktop phase of the DSI. In addition, the source of elevated TRHs in groundwater identified during the DSI is not currently known.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6. Conceptual Site Model

6.1 Potential Areas of Environmental Concern

Based on the site history review and observations of site conditions during the detailed site inspection, AECs and associated COPCs have been identified and are presented in **Table 6.1**.

Table 6.1 Areas of Environmental Concern and Contaminants of Potential Concern

Area of Environmental Concern (AEC)	Contaminants of Potential Concern (COPC)
AEC 1 Former Dry Cleaner and CE Plume 134-138 Henry Street (Lot 1 DP164798, **Figure 2**) Improper disposal/management of dry-cleaning chemicals resultant from the operation of the dry-cleaner	Chlorinated ethenes (PCE, TCE and cis-1,2 DCE) and TRHs
AEC 2 Former Service Station 118 Henry Street (Lot 1 DP113118, **Figure 2**) Improper management of petroleum hydrocarbons associated with the former service station	TRHs, BTEX and lead
AEC 3 Transformers Allen Place Car Park (**Figure 2**) Past spillage and/or leakage of transformer oils	TRHs and PCBs
AEC 4 Lead Impacted Fill Material 42 Station Street (Lot 3 DP1200790, **Figure 2**) Previously identified lead impacted fill material in the location of JHA02	Lead
AEC 5 Fill Materials and Shallow Soils Underlying Building Footprints All areas in which site development activities resulted in the application of fill materials to create current site levels. Application of COPCs as a result of general maintenance and operation of residential/commercial premises through the period of site occupation (pesticides, herbicides, fuel and oil spills, etc.)	Heavy metals, PAHs, TRHs / BTEX, OCPs, PCB, VOCs and asbestos.

6.2 Known Contaminated Media

As discussed in **Section 4.2**, results from Geo-Logix (2016) and JBS&G (2017a) indicated that several contamination impacts are present at the site.

CE impact exists within the vicinity of the former dry-cleaner. The impact has been detected in samples of soil vapour collected to the west and north of the dry cleaner, with PCE and TCE detected at concentrations representing a potential risk to human health in samples collected from probes SV05 and SV10 (**Figure 4C**). Review of analytical data presented in JBS&G (2017a) has provided evidence that the CE impact does not extend south or east of the dry cleaner at concentrations exceeding the site investigation criteria. However, as discussed in **Section 5.1**, there is the potential for CEs to have migrated along the sewerage service infrastructure southwest of the dry cleaner.

Low levels of CEs were detected in soil samples taken from JHA04, within close vicinity to the dry cleaner sewerage infrastructure (**Appendix E**), and CEs were detected in groundwater at PSM01. Detections of CEs in soil and groundwater west and south of the dry-cleaner has demonstrated that lateral and vertical migration of the CEs has occurred.

Soil impacts were not identified that represent risks to future site users. PCE and toluene in groundwater, collected from PSM01, were present at concentrations exceeding the adopted drinking water criteria, which was considered to represent a potential unacceptable risk to future onsite receptors. No other exceedances of the groundwater criteria were reported.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.3 Potentially Contaminated Media

In addition to the known contaminated media discussed in **Section 6.2**, each of the remaining AECs and corresponding COPCs identified in **Table 6.1** have the potential to result in impact to soil and, except for asbestos, to groundwater.

Based on information presented in JBS&G (2017), a single unconsolidated aquifer has been identified at the site which has the potential to be impacted by site contamination. The aquifer of concern exists within the soil lithological unit (which is inclusive of the layer of clay mixed with river gravels and overlying clay absent river gravels) underlain by shale bedrock. All references to groundwater made in the DGI refer to this single aquifer.

6.3.1 Chlorinated Ethene Impact

The extent of the CE impact identified near the dry cleaner has not been fully defined by historical investigations. Review of the sewerage layout plans (**Appendix E**) has indicated that the most significant contamination may potentially be present along the western portion of 134-138 Henry Street.

PCE, TCE and DCE are volatile contaminants and have the potential to result in soil vapour impacts a significant distance from the source of the impact. Previous results have indicated that the contaminants have migrated vertically (as indicated by groundwater impact at PSM01) and laterally (as indicated by historical soil vapour results surrounding the property) from the source of the impact.

Soil vapour to the west of SV10 and to the north of SV05 are considered potentially impacted media based on historical sample results. In addition, given the evidence that CEs have migrated along the sewerage infrastructure, soil vapour along the alignment of the sewerage infrastructure is considered to be potentially impacted. Where groundwater has been impacted by CEs, there remains the potential for deep soil-vapour to be impacted as a result.

Soils in areas within close vicinity to the sewerage infrastructure, as indicated by low level CEs at location JHA04, and/or underlying the impact source may also be impacted.

The extent of CE impact to groundwater underlying and downgradient of the impact source is currently unknown. Given the nature of the contaminants and mobility of the media they have currently been detected within, it is possible that significant impacts to groundwater underlying and downgradient of the dry cleaner exist which have not been identified by previous investigations.

It is noted that land use near the source zone is restricted to commercial occupation. The surrounding properties on the southern side of Henry Street consist of enclosed buildings constructed at-grade. Indoor air within the commercial buildings is also a potentially impacted medium. It is noted that the building located at 121 Henry Street, north of the site, includes a multilevel basement approximately 20 m north of 134-138 Henry Street.

6.3.2 Former Service Station

The presence of former UPSS infrastructure, as may have been present during commercial operation of the service station, is not currently known. Given the absence of documentation pertaining to the UPSSs at the service station, or limited soil/groundwater analytical data within the premises, soil and groundwater in the vicinity of the service station are considered to be potentially impacted media.

Where significant impacts due to tank leakage/ruptures are present, underlying soils at depth and groundwater impacts may be present. Impacts to groundwater, if present, are considered likely to have migrated to the west / north-west, in line with the inferred groundwater flow direction.

Soil vapour analytical results indicated a minor detection of TRH at location SV04 (**Figure 4C,** west of the former service station) and all other soil-vapour analytical results surrounding the former service station (west and south of the service station) were below the laboratory LOR. Given the absence of

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

significant soil vapour concentrations for TRH within samples taken from the vicinity of The Service Station, it is considered unlikely that a significant impact to soil vapour is present as a result of former, undocumented USTs or hydrocarbon spills.

6.3.3 General Site

Soil analytical results generally demonstrated that fill material and shallow natural soils were free from impacts. As documented in **Section 5**, areas underlying current building footprints and concrete hardstands have not been the subject of detailed assessment. Historical site usage and redevelopment activities may have resulted in impacts to shallow soils.

Within the vicinity of the transformers currently present at the site, there is the potential for historical leakage/spillages of transformer oils. Impacts, where present, associated with the transformers are considered likely to be constrained to surface and/or near surface soils and are considered unlikely to have migrated to the reported depth of groundwater (6-8 m bgs).

Where fill materials are present, natural soils have been disturbed, or waste material buried, there is a potential for impacts at depth, consistent with the depth of disturbance. Anthropogenic materials are commonly present in impacted fill/disturbed soil and can be used as an indication of the depth of disturbance. Where fill materials impacted with chemical based contaminants are identified, there is a potential the impact may have migrated laterally and vertically below the fill material into the natural soil profile and/or underlying groundwater.

On the basis of the above, natural soils at depth, soil vapour and groundwater in areas underlying current building footprints at the site are considered potentially impacted media as a result of historical site activities. The extent of the potential impact to natural soils will be dependent upon the size and severity of the overlying impact as well as the properties of the natural soils and groundwater conditions.

6.4 Potential for Migration of Contamination from Site

Contaminants generally migrate from site via a combination of windblown dusts, rainwater infiltration, groundwater migration and surface water runoff. The potential for contaminants to migrate is a combination of:

- The nature of the contaminants (solid/liquid and mobility characteristics);
- The extent of the contaminants (isolated or widespread);
- The location of the contaminants (surface soils or at depth); and
- The site topography, geology, hydrology and hydrogeology.

The COPCs identified as part of the site history review and site inspection are generally in solid (e.g. asbestos, PAHs and metals), liquid (e.g. TPH, BTEX, OCPs and PCBs) or gaseous (e.g. BTEX, Volatile TRH, semi-volatile PAHs) form.

Review of analytical data presented in JBS&G (2017a) has indicated that offsite migration of CE impacted media (soil vapour and groundwater) may be occurring along the northern boundary of the site.

Where significant impacts due to tank leakage/ruptures are present as a result of improper management of hydrocarbon fuels at The Service Station, impacts to soils at depth and groundwater may be present. Impacts to groundwater, if present, are considered likely to have migrated to the west / north-west, in line with the inferred groundwater flow direction.

The ground surfaces surrounding the remaining AECs are comprised of a mixture of sealed pavements and building footprints. The extent of surface water infiltration into the subsurface within the vicinity of the remaining AECs is therefore considered to be limited. The solubility of chemical contaminants in soil, in addition to rate of surface water intrusion, perched water seepage

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

and groundwater movement across the site will influence the potential for migration of soil and groundwater based contamination within and from the site. Except for the dry cleaner and service station, where localised impacts to soil are/may be present, these are considered not likely to be present at an extent which would result in migration of contamination at a scale where off-site migration would require to be addressed.

Whilst hardstand pavements and building footprints are maintained at the site, the potential for migration via surface water runoff and windblown dust is low.

6.5 Human / Ecological Receptors and Exposure Pathways

Potential human receptors of environmental impact include future residents, visitors and construction/maintenance contractors engaged to work at the site, who may potentially be exposed to COPCs through inhalation or direct contact with impacted soils, groundwater or soil-vapour present within the site. Additionally, migration of contaminants via infiltration into the groundwater and migration of contaminated soil-vapour also poses a risk to sensitive human receptors.

Should redevelopment of the site occur, potential human receptors may in the future include:

- Potential dermal contact with and ingestion of impacted soils/groundwater as present at shallow depths and/or accessible by future excavations by site workers and/or occupants; and
- Potential Inhalation of vapours migrating upwards and laterally from fill and/or natural soil.

The site is primarily covered by hardstand pavements and building footprints, however several of the identified AECs have the potential to impact onsite ecological receptors. Possible off-site ecological receptors are limited to potential impacts associated with groundwater and soil-vapour migrating from the site.

Current and future human receptors on the site could be potentially exposed to soil contaminants by oral, dermal and inhalation pathways. Direct contact pathways (oral and dermal) will only be relevant for near surface soils for most site users. However, potential construction and future intrusive/excavation worker exposures could occur for deeper soils.

The reported fluid electrical conductivity (JBS&G 2017) indicate that the water present within all monitoring wells at the site is not suitable for drinking and is unsuitable for most types of irrigation. In addition, no registered groundwater bores have been identified as being used for the extraction of drinking water and given the urbanised nature of the site, it is not expected that water within the aquifer is or will be utilised by for the purposes of drinking water or associated uses (such as swimming pool filling). Inhalation pathways are relevant where asbestos, volatile or semi-volatile COPCs are present. Occupants of the buildings surrounding the identified CE impacts are potentially receptors due to migration of soil vapour.

6.6 Preferential Pathways

For the purpose of this assessment, preferential pathways have been identified as natural and/or man-made pathways that result in the preferential migration of COPC as either liquids or gasses.

Review of the sewerage design layout plans (**Appendix E**) has identified a potential a preferential pathway abutting the western boundary of the former dry-cleaner. The preferential pathway is shown on **Figure 3**. The preferential pathway is considered likely to have facilitated transport of CEs from the dry cleaner.

Man-made preferential pathways are likely present throughout the site, generally associated with areas of previously disturbed fill material and service easements.

Natural preferential pathways are likely limited to natural lithological borders, such as between porous soils and bedrock, where infiltrating groundwater is vertically confined and begins to migrate laterally.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.7 Source to Receptor Pathway Summary

Table 6.2 below presents a summary of potential source to receptor pathways identified in **Section 6.1** to **6.6.**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 6.2 Conceptual Site Model Source to Receptor Summary

Areas of Environmental Concern	Contaminant of Potential Concern / Media	Pathway -> Uptake	Receptor
The Former Dry Cleaner	Chlorinated Ethenes / Soil-vapour	Advection into Buildings and/or Open Atmosphere Environments -> Inhalation	Current and future construction/maintenance workers and/or occupants of the site and downgradient areas
		Offsite Migration via Preferential Pathways then Advection into Buildings and/or Open Atmosphere -> Inhalation	Current and future construction/maintenance workers and/or occupants of the site
	Chlorinated Ethenes / Soil and Groundwater	Physical Contact -> Oral or Dermal Ingestion	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Groundwater -> Oral/Dermal Contact, Inhalation or Biological Uptake	Downstream ecological receptors (Peach Tree Creek) Current and future recreational users and construction/maintenance staff at Peach Tree Creek
The Former Service Station	TRH and BTEX / Soil-vapour	Advection into Buildings and/or Open Atmosphere Environments -> Inhalation	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Preferential Pathways then Advection into Buildings and/or Open Atmosphere -> Inhalation	Current and future construction/maintenance workers and/or occupants of the site
	TRH, BTEX / Groundwater	Disturbance/Physical Contact -> Oral or Dermal Ingestion	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Groundwater -> Oral/Dermal Contact, Inhalation or Biological Uptake	Downstream ecological receptors (Peach Tree Creek) Current and future recreational users and construction/maintenance staff at Peach Tree Creek
	Heavy Metals / Soil and Groundwater	Disturbance/Physical Contact -> Oral or Dermal Ingestion	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Groundwater -> Oral/Dermal Contact, Inhalation or Biological Uptake	Downstream ecological receptors (Peach Tree Creek) Current and future recreational users and construction/maintenance staff at Peach Tree Creek
Fill Materials and Shallow Surface Soils	Heavy Metals / Soil and Groundwater	Disturbance/Physical Contact -> Oral or Dermal Ingestion	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Groundwater -> Oral/Dermal Contact, Inhalation or Biological Uptake	Downstream ecological receptors (Peach Tree Creek) Current and future recreational users and construction/maintenance staff at Peach Tree Creek
	Asbestos / Soil and Material	Disturbance -> Inhalation	Current and future construction/maintenance workers and/or occupants of the site
	TRH, PAH, BTEX, OCPs, OPPs and PCBs / Soil and Groundwater	Disturbance/Physical Contact -> Oral or Dermal Ingestion	Current and future construction/maintenance workers and/or occupants of the site
		Offsite Migration via Groundwater -> Oral/Dermal Contact, Inhalation or Biological Uptake	Downstream ecological receptors (Peach Tree Creek) Current and future recreational users and construction/maintenance staff at Peach Tree Creek

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. Sampling and Analysis Plan

7.1 Data Quality Objectives

DQOs for the investigation have been developed in accordance with the process outlined in Appendix B of the NEPM, NEPC (2013), and are discussed in the following sections.

7.1.1 State the Problem

As discussed in **Section 1**, Council intends on divesting the site for the purpose of redevelopment as part of the proposed Central Park Village. Additional investigation works are required to determine the severity and extent of impacts at the site to inform Council and potential developers of the nature of contamination at the site. As such, the following data gaps have been identified as being required to be addressed as part of this DGI:

- **AEC 1:** the nature and extent of impacted mobile media (groundwater and soil-vapour) as a result of contamination from the operation of the dry cleaner located at 134-138 Henry Street (**Figure 2**), including indoor air quality within onsite buildings surrounding the impact source (**Figure 6**); and
- **AEC 2:** the potential for groundwater impact as a result of the operation of The Service Station at the site.

7.1.2 Identify the Decision

The decisions below are generally based on the EPA (2017):

- Are there any unacceptable risks to likely future onsite receptors?
- Are there any impacts of chemical mixtures?
- Are there any aesthetic issues at the site?
- Is there any evidence of, or potential for, migration of contaminants from the site?

7.1.3 Identify Inputs to the Decision

Inputs identified to provide sufficient data to make the decisions nominated above include:

- Desktop review;
- Detailed site inspection/walkover;
- Physical observations and interpretation of potentially contaminated media through the collection of soil, groundwater and soil vapour samples;
- Development of appropriate assessment criteria for evaluation of potential soil, groundwater and soil-vapour impacts;
- Field parameters as measured utilising calibrated equipment during the intrusive investigation including assessment of soil sample headspace, groundwater physicochemical characteristics and soil-vapour characteristics;
- Laboratory analysis of selected samples of potentially contaminated media for COPCs; and
- Confirmation that data generated by sample analysis are of an acceptable quality to allow reliable comparison to assessment criteria by assessment of quality assurance / quality control (QA/QC) as per the data quality indicators established in **Section 7.1.6**.

Specifically, sufficient data needed to be collected from each of the potentially impacted media identified in AEC 1 and AEC 2 for the associated COPC (**Table 6.1**).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.1.4 Define the Study Boundaries

The study boundaries were generally limited to the cadastral boundaries of the site. Three sampling points were installed within Henry Street, 2 m to 15 m north of the site boundary (**Figure 4B** to **4D**). The site area and approximate Map Grid of Australia (MGA) boundary points are shown on **Figure 2.** The vertical extent of the investigation was limited to the base of the deepest borehole (JBMW03) at 12.1 m bgs.

As discussed in **Section 7.3.1.3**, acquisition of necessary vapour data is dependent upon atmospheric conditions, it was anticipated that appropriate atmospheric conditions would arise in the period between March and April 2018. The remainder of the field investigation program was also anticipated to be completed during this period.

Whilst it is understood that several data gaps pertaining to the characterisation of potential contamination exist, site access constraints due to the presence of large occupied structures currently prevent detailed assessment of all the identified AECs. Council has communicated to JBS&G that, in *lieu* of full site characterisation, the items most consequential to redevelopment strategies are the foremost concern.

7.1.5 Develop and Decision Rule

Laboratory analytical data was assessed against the appropriate criteria as identified in **Section 6**. Statistical analyses of soil data was undertaken, where appropriate, in accordance with relevant guidance documents. The following statistical criteria was utilised:

- The 95 % Upper Confidence Limit (UCL) on the average concentration for each analyte (calculated for samples collected from consistent soil horizons, stratigraphy or material types) must be below the adopted criterion;
- No single analyte concentration shall exceed 250 % of the adopted criterion; and
- The standard deviation of the results must be less than 50 % of the criterion.

The decision rules adopted to answer the decisions identified in **Section 7.1.2** are summarised in **Table 7.1**.

Table 7.1 Summary of Decision Rules

Decisions Required to be Made	Decision Rule
1. Are there any unacceptable risks to onsite future receptors?	A) Soil analytical data was compared against EPA endorsed criteria. Statistical analysis of the soil data was completed in accordance with relevant guidance documents, as appropriate, to facilitate the decisions. The criteria in **Section 6.2**, and the following statistical criteria were adopted with respect to soils: Either: the reported concentrations are all below the site criteria; Or: the average site concentration for each analyte is below the adopted site criterion; no single analyte concentration exceeded 250 % of the adopted site criterion; and the standard deviation of the results is less than 50 % of the site criterion; And: the 95 % UCL of the average concentration for each analyte is below the adopted site criterion. If the statistical criteria stated above were satisfied, the answer to the decision is No. If the statistical criteria are not satisfied, the answer to the decision is Yes.
	B) Groundwater analytical data was compared against EPA endorsed criteria. If the reported concentrations are all below the site criteria, the answer to the decision is No; If analytical concentrations are in excess of the site criteria, further consideration of potential risks would be required to establish whether the results are representative of a risk to future site users. If this was not the case, then the answer to the decision is Yes
	C) Vapour analytical data was compared against EPA endorsed Tier 1 criteria. If the reported concentrations are all below the adopted Site Criteria, the answer to the decision is No; If analytical concentrations were in excess of the site criteria for one or more

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Decisions Required to be Made	Decision Rule
	samples, the answer to the decision is Yes. Alternatively, consideration may be given to proceeding to a Tier II site specific assessment to further evaluate the potential risks.
	D) Indoor air analytical data was compared against EPA endorsed Tier 1 criteria. If the reported concentrations are all below the adopted Site Criteria, the answer to the decision is No; If analytical concentrations were in excess of the site criteria for one or more samples, the answer to the decision is Yes. Alternatively, consideration may be given to proceeding to a Tier II site specific assessment to further evaluate the potential risks.
3. Are there any contaminant odours, or other unacceptable aesthetic concerns?	If there are any unacceptable odours, or the presence of asbestos fragments or similar, the answer to the decision is Yes. Otherwise, the answer to the decision is No.
4. Is there any evidence of, or potential for, migration of contaminants from the site at levels which represent unacceptable risks to offsite receptors?	Assessment of the potential for groundwater impact at the site included installation of three new groundwater monitoring wells at the site and four new well outside of the site, across the northern boundary. The five new (JBMW01 to JBMW07) and three existing monitoring wells (PSM01 to PSM03) were sampled and the resulting groundwater contaminants concentrations compared against adopted assessment criteria. Assessment of the potential for soil vapour impact at the site included installation and sampling/analysis of additional 7 sub-slab soil vapour probes and 2 deep soil vapour monitoring wells. Three of the sub-slab probes were installed along the northern boundary, and three along the sewer service infrastructure, west of the dry cleaner. The resulting concentrations were compared against adopted EPA based criteria. Based on assessment results, is there any evidence of, or the potential for, unacceptable contaminant concentrations to migrate from the site? If yes, the answer to the decisions is Yes. Otherwise, the answer to the decision is No.

7.1.6 Specific Limits on Decision Errors

This step was to establish the decision maker's tolerable limits on decision errors, which are used to establish performance goals for limiting uncertainty in the data. Data generated during this project must be appropriate to allow decisions to be made with confidence.

Section 2.4 of *Contaminated Sites: Sampling Design Guidelines,* EPA (1995[21]), indicates that a site investigator should maintain a confidence level no lower than 95 %. As such, for the assessment of soil samples, the 95 % upper confidence limit for contaminant concentrations was compared to the adopted site assessment guidelines where required, providing the statistical criteria in **Table 5.1** are met.

Specific limits for this project were adopted in accordance with the appropriate guidance from the NSW EPA National Environmental Protection Measure (NEPM), NEPC (2013), appropriate Data Quality Indicators (DQIs, used to assess quality assurance / quality control) and standard JBS&G procedures for field sampling and handling.

To assess the usability of the data prior to making decisions, the data was assessed against pre-determined DQIs for to precision, accuracy, representativeness, comparability, completeness and sensitivity (PARCCS) parameters. The acceptable limit on decision error is 95 % compliance with DQIs.

The pre-determined DQIs established for the project are discussed below in relation to the PARCCS parameters, and are shown in **Table 5.2**.

[21] *'Contaminated Site: Sample Design Guidelines'*, NSW Environment Protection Authority, ISBN 0 7310 3746 1, September 1995, EPA (1995)

Version: 1, Version Date: 14/04/2021

- **Precision** – measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** – measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** – expresses the degree which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the site, and by using an adequate number of sample locations to characterise the site to the required accuracy.
- **Comparability** – expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples; and ensuring analysing laboratories use consistent analysis techniques; and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** – expresses the appropriateness of the chosen field and laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted site assessment criteria.

7.2 Optimise the Design of Obtaining Data

Various strategies for developing a statistically based sampling plan are identified in *Contaminated Sites: Sampling Design Guidelines,* EPA (1995[22]), including judgemental, random, systematic and stratified sampling patterns. The adopted sampling methodology is discussed in the following sections.

Based on the identified AECs and associated potentially impacted media, a judgemental sampling plan has been developed such that sufficient characterisation data was collected to address each of AEC 1 and AEC 2 (**Table 6.1**).

The sampling protocol comprised the following:

- Installation, development, sampling and analysis of seven new groundwater monitoring wells to the east, north, west and southwest of 134-138 Henry Street. It is noted that the northeast well was installed immediately northwest of the former service station;
- Soil inspection, sampling and analysis of excess soils generated during the installation of the new monitoring wells;
- Re-development and sampling of the three existing groundwater monitoring wells (PSM01 to PSM03);
- Installation, development, sampling and analysis of 7 new sub-slab soil vapour probes and two deep soil vapour wells; and
- Four separate indoor air sampling events within 134-138 Henry Street and Shop 3/140 Henry Street.

The sampling and analysis program is summarised in **Table 7.3**. Sampling locations are shown on **Figure 3**.

7.3 Soil Investigation Methodology

Soil sampling was completed at five borehole locations, which were converted to monitoring wells JBMW01to JBMW05 (**Figure 4A** and **4B**)**.** Soil sampling was completed via a combination of manual and mechanical excavation using hand auger, push tube and solid flight auger drilling methods. Soil samples were collected from the soil immediately underlying hardstand pavements, and then 0.5 m to 1 m intervals to the top of shale bedrock (11.5 m to 12 m bgs).

During the collection of soil samples, features such as seepage, discolouration, staining, odours and other indicators of contamination were noted where observed. A calibrated PID fitted with a 10.6 eV lamp was utilised to screen for VOCs within the material sampled from JBMW01 to JBMW04, to assist in selection of soil samples for laboratory analysis. Calibration records are included in **Appendix G.**

Soil samples were collected using decontaminated hand tools and a new pair of nitrile gloves, directly from disposable push tube liners. Samples were then immediately transferred to laboratory supplied sample jars and bags. The jars were stored in a chilled esky for sample preservation prior to and during shipment to the testing laboratory. The bags were stored out of direct sunlight for approximately 5 minutes, then punctured by the tip of the PID for field assessment of VOC contamination. A chain of custody form will be completed and forwarded with the samples to the testing laboratory.

The final analytical schedule was based on field observations, and detailed in **Table 7.3**

[22] *'Contaminated Site: Sample Design Guidelines'*, NSW Environment Protection Authority, ISBN 0 7310 3746 1, September 1995, EPA (1995)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.4 Groundwater Investigation

7.4.1 Groundwater Monitoring Well Installation

Seven groundwater monitoring wells were installed, as shown in **Figure 4A** and **4B**. The locations of the wells are as follows:

- JBMW01: 50 m to 60 m west of the dry cleaner, adjacent to the northern boundary of the site.
- JBMW02: 2 m north of the site boundary, approximately 10 m north of the dry cleaner, within the Henry Street road reserve;
- JBMW03: immediately northwest of The Service Station, within the footpath;
- JBMW04: 50 m to 60 m west of the dry cleaner, approximately in alignment with the undergrounds sewer infrastructure;
- JBMW05: 15 m north of the site boundary, approximately 25 m northwest of the former dry cleaner;
- JBMW06: 80 m north of the site boundary, approximately 100 m north of the former dry cleaner; and
- JBMW07: 95 m north of the site boundary, approximately 110 m north west of the former dry cleaner.

The wells were generally installed to the top of the shale bedrock and screened from the depth of installation to the top of the river gravel layer. Groundwater monitoring well installation logs are included in **Appendix F**. It is noted that wells JBMW02 was not able to be installed to the top of the shale bedrock due to hole collapse and preclusion of readily implementable drilling methods, such as hollow flight auger, because of the presence of large river gravels. JBMW02 was installed within the river gravel layer. A bentonite plug was utilised at each monitoring well to seal the river gravel layer from the borehole created during well installation. No evidence of gross contamination from the dry cleaner was identified during drilling.

The wells were constructed from 50 mm un-plasticised polyvinyl chloride (uPVC) screen and casing, combined with a lockable cap and steel gatic cover. Surrounding the uPVC screen a graded (2mm) sand was utilised to construct a 'gravel pack' which limited clogging of the screen with excess sediments/soils. Additionally, above the screened interval, a bentonite seal was installed to reduce the potential for surface water, perched water and/or liquid phase contaminants to enter the well. A steel gatic cover was installed at the ground surface within concrete, flush with the surroundings.

7.4.2 Well Development and Sampling

After installation, the new and previously installed monitoring wells were developed to remove excess silt and sediment resultant from the installation process. The wells were then allowed to settle for a week prior to sampling. Groundwater sampling was conducted in accordance with the Groundwater Sampling Guidelines, VIC EPA (2000[23]).

Each monitoring well was gauged with an Interface Probe (IP) which can detect NAPLs. The groundwater at each well was then purged with a QED low flow/micropurge submersible bladder pump, using fresh disposable bladders and low-density polyethylene tubing, to remove the standing water. During removal, physiochemical parameters (pH, electrical conductivity, dissolved oxygen, reduction-oxidation potential and temperature) were monitored until stabilisation. Groundwater samples were taken from the end of the disposable LDPE tubing after parameter stabilisation has occurred.

[23] *'Groundwater Sampling Guidelines'*, Victoria Environment Protection Authority, April 2000, VIC EPA (2000);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Collected groundwater samples were immediately filtered (as necessary) and transferred to laboratory supplied sample bottles. The sample containers were transferred to a chilled iced box for sample preservation prior to and during shipment to the testing laboratory. A chain of custody form was completed and forwarded with the samples. Samples were analysed in accordance with the laboratory schedule (**Table 7.3**).

It is noted that an obstruction present within PSM03 precluded sampling with a micro-purge submersible pump. On this basis, a sample was collected using a foot-valve. The foot-valve sampling methodology may result in underestimation of volatile compounds within collected samples. As a result, the results from PSM03 should be considered indicative only.

7.5 Soil Vapour Assessment

Seven soil vapour probes were installed in the locations marked on **Figure 4C**. Soil vapour probes were installed via the following process:

- Clearance of proposed soil vapour locations by a professionally licenced service locator;
- Puncture of surface hardstand (concrete or asphaltic pavement) via rotary hammer drill, with a 20 mm drill bit, through to the underlying soils;
- 'Flossing' of the drill hole to remove excess concrete dust and/or soil;
- Installation of a 300 – 400 mm nylon tube, fitted with steel mesh filter on the bottom and closed three-way valve on the accessible end;
- Backfilling the drill hole with graded sand, to a minimum of 5 cm above the steel mesh filter;
- Sealing of the drill hole via application of air drying clay covered by a concrete/bentonite slurry;
- Allowing the soil-vapour probe to equilibrate for a period of 30 minutes following sealing with concrete/bentonite slurry;
- Application of a 'shroud' comprising an air tight container lined with isopropyl alcohol doused material to the base of the nylon tube, where sealed in place with the bentonite slurry;
- Purging of the drill hole via pumping through a calibrated mx6 multi-gas detector;
- Concentrations of oxygen (O_2), VOCs and carbon dioxide (CO_2) were monitored throughout purging until stabilization had occurred;
- Where detections of VOCs indicated a leak as present and isopropyl alcohol vapour was intruding into the nylon tube, the soil vapour probe will be removed and reinstalled;
- Where purging was successful, and no leak is indicated by monitored parameters, 25.0 L of soil vapour was removed from the sub-slab vapour probe using a calibrated low-low air pump. The pump was connected to the back end of a carbon tube, allowing for soil vapour to be drawn over the activated carbon; and
- Removal of the soil vapour probe post-sampling and reinstatement of the drill hole with concrete, consistent with the surrounds.

Soil vapour installation logs from JBS&G (2017) and the current assessment are provided in **Appendix F.** This sub-slab soil-vapour probe installation methodology is similar to 'direct push' push methods in the potential for atmospheric ingress during installation. Consistent with the NEPC (2013) recommendation for equilibration period for 'direct push' methods 30 minutes is adequate to allow equilibration of the sub-slab probe with the surrounding soil-vapour.

The carbon tubes were immediately transferred into a labelled, sealed container and stored within an icebox at ambient temperature, consistent with laboratory advice and NATA accreditation of the

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

sample handling. Samples were not chilled in order to minimise the potential for condensation on and within the tube, which may compromise the sample.

In addition to the above, two deep soil vapour probes (SV18 and SV19) were installed on the northern side of Henry Street (**Figure 4C** and **4D**). The probe installation logs are presented in **Appendix F**. Deep probes were installed on 5 November 2018 and sampled on 15 November 2018 (10 days equilibration period). Deep soil vapour probes were sampled by extraction of a 6 L volume of soil-vapour with calibrated low-flow pumps (100 mL/min for 60 minutes) and monitoring of soil gases with a calibrated multi gas meter. The soil vapour sampling probes of SV18 and SV19 were installed to a depth interval of 4.7 m to 5.0 m bgs. These depth intervals were selected to minimise the potential for soil moisture present directly above the water table to influence the sampling results. JBSV18 and JBSV19 construction details are provided following:

- **JBSV18**
  Probe tip/filter – 4.8-4.9 m bgl
  Sand pack (well) – 4.7-5.0 m bgl
  Bentonite (seal) – 2.7-4.7 m bgl
  Concrete (seal) – 0-2.7 m bgl
- **JBSV19**
  Probe tip/filter – 4.8-4.9 m bgl
  Sand pack (well) – 4.7-5.0 m bgl
  Bentonite (seal) – 3.7-4.7 m bgl
  Concrete (seal) – 0-3.7 m bgl

7.6 Indoor Air Assessment

Three premises were assessed for COPCs in indoor air, Shop 1 and Shop 3/134-138 Henry Street and Shop 3/140 Henry Street, as shown on **Figure 4D**. The indoor air assessment was undertaken over four single day mobilisations, targeting atmospheric conditions conducive to incurring the 'worst case' scenario for soil vapour to indoor air advection. One sampling event was undertaken when the site was predicted to be experiencing a decreasing atmospheric pressure on 17 April 2018, and the other sampling events were undertaken during hot conditions 35^{o}C on 9 April, 3 May and 15 November 2018 (BOM 2018[24]).

The sampling locations were selected based on the site layout encountered during the sampling event, which was intended to target an area of low air flux (water closets) and an area nearby to air conditioning/atmospheric control equipment within general occupational areas (shop areas).

Ambient air was sampled for a period of approximately 8 hours, representative of a commercial worker's daily shift), during the worst-case conditions. Samples were collected via Summa Canister and analysed in accordance with **Table 7.1**

7.7 Decontamination

Prior to the commencement of sampling activities, non-disposable sampling equipment (solid flight augers, rotary hammer drill and interface probe) were cleaned with a high-pressure water/detergent (Decon 90) spray, rinsed with water and then air dried. The equipment was then inspected to ensure that no soil, oil, water, debris or other contaminants are apparent on the equipment prior to the commencement of works. This decontamination procedure was repeated in between each sampling location before ground disturbance/sampling activities.

[24] *'Penrith, New South Wales, April 2018 Daily Weather Observations'*, Product IDCJDW2111.201804 Prepared on Monday 30 April 2018, Station 067113, Bureau of Meteorology (BOM 2018);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Soil samples were collected from push tube sleeves which were removed from the advancement casing and laid on clean plastic sheets for inspection, soil samples were collected directly from the push tube sleeve. A new pair of disposable nitrile gloves were used to collect each sample.

Non-disposable groundwater monitoring and soil vapour probe installation equipment was decontaminated in accordance with the procedure detailed above in between each monitoring well/soil vapour probe location. Soil vapour and groundwater samples was collected using dedicated disposable sampling equipment which was disposed of after each individual sample.

Sampling equipment including, hand trowels, hand augers and the push tube head were subsequently decontaminated using the above process between each sampling location and fresh liners were used at each location advanced via push tube. Decontamination records are provided in **Appendix G**.

A rinsate sample from the non-disposable sampling equipment was progressively collected in between sampling locations to determine the effectiveness of the decontamination procedures implemented on re-usable sampling equipment. The rinsate sample was analysed for each of the COPCs, analysed within primary samples.

7.8 Duplicate and Triplicate Sample Preparation

At selected sample locations, sufficient media was collected to provide a primary, blind (intra-laboratory) duplicate and split (inter-laboratory) duplicate (triplicate) sample using the sampling methodologies outlined above.

The collected soil samples were divided laterally into three samples with minimal disturbance to reduce the potential for loss of volatiles and placed in three clean glass jars and sample bags as appropriate. Soil samples were not homogenised in order to minimise the loss of volatiles.

The collected groundwater samples were extracted from the groundwater wells after purging and the primary, blind duplicate and split duplicate sample containers were filled consecutively, one quarter at a time. Groundwater samples were not homogenised in order to minimise the loss of VOCs.

The collected soil vapour samples were extracted from soil vapour probes after purging. Sub-slab intra-laboratory duplicate samples were collected simultaneously to the primary sample (at location SV15) by application of a second pump adjoined to the sample train with a Y-splitter (three way valve). Sub-slab duplicate samples were collected simultaneously to avoid differences in advection as a result of changing weather conditions. Deep soil-vapour intra- and inter-laboratory duplicate samples were collected immediately following collection of the primary samples.

7.9 Laboratory Analysis

JBS&G contracted Eurofins MGT (Eurofins) as the primary laboratory for the required chemical analyses. The secondary laboratory was Envirolab Services Pty Ltd (Envirolab). Both laboratories were NATA accredited for the required analyses. In addition, the laboratories were required to meet JBS&G's internal QA/QC requirements. The completed analysis schedule is summarised in **Table 7.3.**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 7.3 Analytical Schedule

Sample Type	Round	No. of Sampling Locations	Analyses (exc. QA/QC)
Soil	Round 1 (9 and 10 April 2018)	4 Borehole Locations (JBMW01, JBMW02, JBMW03 and JBMW04)	TRHs and VOCs – 8 samples PAHs – 3 samples Lead – 3 samples Heavy metals – 1 sample
	Round 2 (5 November 2018)	1 borehole location (JBMW05)	Total organic carbon content – 2 samples
Soil Leachate	N/A (9 and 10 April 2018)	1 Borehole Location (JBMW04)	TCLP (PAHs and Lead) – 1 sample
Groundwater	Round 1 (16 April 2018)	7 Monitoring Well Locations (PSM01, PSM02, PSM03, JBMW01, JBMW02, JBMW03 and JBMW04)	vTRH/BTEX – 7 samples svTRHs – 6 samples VOCs – 7 samples Heavy metals – 1 sample
	Round 2 (15 and 21 November 2018)	5 Monitoring Well Locations (JBMW02, JBMW05, JBMW06, JBMW07 and PSM01)	VOCs/BTEX – 5 samples Nitrate, Sulfate, Chloride and Ferrous Iron – 3 samples Methane, Ethene, Ethane – 3 samples pH, Total Organic Carbon – 3 samples Alkalinity – 3 samples
Soil Vapour	Round 1 (17 April 2018)	7 Sub-slab Soil Vapour Probe Locations (SV11 to SV17)	VOCs – 7 samples
	Round 2 (15 November 2018)	2 Soil Vapour Wells (SV18 and SV19)	VOCs – 2 samples
Indoor Air Assessment	Round 1 (9 April 2018)	2 Buildings, 4 Locations	T015 VOCs – 4 samples
	Round 2 (17 April 2018)	2 Buildings, 2 Locations and ambient air	T015 VOCs – 5 samples
	Round 3 (3 May 2018)	1 Building, 1 Location	T015 VOCs – 1 sample
	Round 4 (15 November 2018)	2 Buildings, 3 Locations	T015 VOCs – 3 samples

In addition to the above primary analyses, to address the DQIs, field duplicate and triplicate soil, groundwater, and soil vapour samples were analysed at a rate of one per 20 primary samples. A field duplicate sample was collected at one indoor air sampling location. A rinsate sample was obtained from non-disposable sampling equipment each day that soil or groundwater sampling was undertaken, plus a single trip spike and single trip blank accompanied each sample batch where groundwater and soils were analysed for volatile COPCs.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8. Assessment Criteria

8.1 Regulatory Guidelines

Development of site assessment criteria and the associated scope of investigation will be undertaken with consideration to aspects of the following guidelines, as relevant:

- *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013 (No. 1)*, National Environment Protection Council, NEPC (2013);
- *Contaminated Sites: Sampling Design Guidelines*, NSW EPA, 1995, EPA (1995);
- *Contaminated Land Management: Guidelines for the NSW Site Auditor Scheme (3rd Edition).'* NSW Environmental Protection Authority, November 2017, EPA (2017);
- *Contaminated Sites: Guidelines on Duty to Report Contamination under the Contaminated Land Management Act 1997*, NSW DECC, June 2009, DECC (2009); and
- *Contaminated Sites: Guidelines for Consultants Reporting on Contaminated Sites*, NSW OEH, 2011, OEH (2011).

8.2 Soil and Soil Vapour Assessment Criteria Selection

As per the decision process for assessment of urban development site, EPA (2017), a set of health and ecological assessment thresholds derived from NEPC (2013) will be used for evaluation of site contamination data collected for this assessment. To assess the risks posed to current and future site users, the analytical data acquired during JBS&G (2017a) and the current assessment have been compared against criteria pertaining to the current site layout (commercial/industrial) and the proposed mixed uses of the site (residential, public open space and commercial/industrial), as noted in **Section 1.1**.

To assess potential risks posed to future site users, the site has been compared to distinct land use criteria for each of the proposed development areas. The western site portion falls within the 'Proposed Green Spaces' and the eastern portion of the site falls within the 'Proposed Building Development and Green Spaces' portion (as shown on **Figure 2**). The site is zoned Commercial Core (B3) and Public Recreation (RE1) under the Penrith Local Environmental Plan 2010, Penrith (2010).

Where there are no NSW EPA endorsed thresholds for individual COPC the laboratory limit of reporting (LOR) was adopted as an initial screening value for the purposes of this assessment.

The adopted site criteria are presented in **Table A(1), Table A(2)** and **Table C.**. Relevant guidelines have been adopted from Section 6 of Schedule B1 NEPC (2013) and are presented below:

Health Based Criteria

Relevant tables:

- Table 1A(1) 'Health Investigation Levels for Soil contaminants';
- Table 1A(2) 'Interim Soil Vapour Health Investigation Levels for Volatile Organic Chlorinated Compounds';
- Table 1A(3) Soil HSLs for Vapour Intrusion;
- Table 1A(4) Groundwater HSLs for Vapour Intrusion;
- Table 1A(5) Soil Vapour HSLs for Vapour Intrusion.

Ecological Screening Levels and Ecological Investigation Levels

Ecological Screening Levels (ESLs) for the site were obtained from Table 1B(6) 'ESLs for TPH Fractions F1-F4, BTEX and Benzo(a)pyrene in Soil' under 'Urban residential and public open space' and 'commercial and industrial' land use scenarios.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Site specific Ecological Investigation Levels (EILs) were derived as part of JBS&G (2017a). The criteria presented in JBS&G (2017a) have been adopted for this assessment.

Management Limits

Management limits for consideration of the formation of Light Non-Aqueous Phase Liquids (LNAPLS), fire and explosive hazards, and effects on buried infrastructure have been obtained from Table 1B(7) 'Management Limits for TPH Fractions F1-F4 in Soil' under 'Urban residential and public open space' and 'commercial and industrial' land use scenarios. The management limit adopted for the purpose of comparison was based on site observations reported in JBS&G (2017a).

Proposed Building Development and Green Spaces

Land use scenarios adopted:

- Residential with minimal opportunities for soil access; includes dwellings with fully and permanently paved yard space such as high-rise buildings and apartments (HIL-B and HSL-B);
- Public open space such as parks and playgrounds (HIL-C and HSL-C);
- Commercial/industrial; including premises such as shops and offices (HIL-D and HSL-D);

Proposed Green Spaces

The land use scenario adopted for Proposed Green Spaces site portion is 'public open space such as parks and playgrounds (HIL-C and HSL-C)'

8.3 Groundwater Assessment Criteria

As discussed in **Section 6.5**, it is not expected that groundwater at the site will be extracted and used for drinking water due to the relatively high salinity/total dissolved solids observed at all monitoring well locations. However, as a conservative guideline, the health and aesthetics based *Australian Drinking Water Guidelines* (NHMRC 2017[25]) for drinking water have been adopted for the purposes of the assessment.

Conservative screening criteria, for the assessment of risk to construction/maintenance workers as a result of short term work involving interaction with groundwater at the site, has been adopted as 10 times the health values for Drinking Water published in (NHMRC 2017).

To assess the potential risk of contaminated groundwater migrating from the site to Peach Tree Creek, reference has been made to the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* ANZAST (2018[26]). Given the heavily urbanised nature of the receiving water body, a 95 % protection of species value has been adopted. Where no high reliability values have been specified, low reliability values have been utilised for the purpose of site assessment and screening.

For the purpose of screening, groundwater assessment criteria have also been adopted from the United States Environment Protection Agency *Regional Screening Levels for Residential Tap Water* (US EPA 2018[27]) when guidelines are not present in the adopted GIL or HSL (noting the RSLs are conservatively based on an excess lifetime cancer risk of 10^{-6}).

8.4 Indoor Air Criteria

The criteria for assessment of indoor air concentrations is adopted from the NEPM (NEPC 2013). Consistent with Table 1A(2) 'Interim Soil Vapour Health Investigation Levels for Volatile Organic Chlorinated Compounds', interim soil vapour HILs were calculated based on adjusting by the attenuation factor for concentrations of Volatile Organic Chlorinated Compounds (VOCCs) in indoor

[25] *'National Water Quality Management Strategy – Australian Drinking Water Guidelines 6 2011', National Health and Medical research Council,* October 2017, NHMRC 2011;

[26] *'Australian and New Zealand Guidelines for Fresh and Marine Water*Australian and New Zealand and Austrlaian State and Territory Governments, ANZAST (2018);

[27] *Regional Screening Levels for Residential Tap Water*. United States Environment Protection Agency, May 2018, US EPA 2018;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

air to sub-slab soil vapour of 10 as adopted in NEPC (2013) for the derivation of the criteria. On this basis, the adopted screening criteria was calculated by multiplying the interim soil vapour HILs by 0.1.

The current indoor air assessment is being undertaken to assess risks to current site users under the ongoing commercial/industrial land use. On this basis, no comparison with criteria for other land use scenarios has been undertaken.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9. Quality Assurance / Quality Control

Analysis of the Quality Analysis / Quality Control (QA/QC) has been undertaken for the analytical results as summarised in **Table 9.1** and discussed in **Section 7.2**. Detailed QA/QC results are included in the laboratory reports in **Appendix H**, and in the Quality Assurance/Control in **Appendix I.**

Table 9.1 QA/QC Results Summary

Data Quality Indicator	Results	DQI met?
Precision		
Soil Blind duplicates (intra laboratory)	0-67 % RPD Intra laboratory samples were analysed at a rate greater than 1 in 20 samples.	Partial[1]
Soil split duplicates (inter laboratory)	0-67 % RPD Inter laboratory samples were analysed at a rate greater than 1 in 20 samples.	Partial[1]
Groundwater blind and split duplicates (intra- and inter-laboratory)	0-189 % RPD Intra laboratory samples were analysed at a rate of 1 in 7 samples.	Partial[1]
Soil vapour blind and split duplicates (intra- and inter- laboratory)	0-79 % RPD Intra laboratory samples were analysed at a rate of 1 in 7 samples.	Partial[1]
Indoor Air blind duplicates (intra-laboratory)	0-4 % RPD	Yes
Laboratory duplicates	0-50 % RPD Intra laboratory samples were analysed at a rate greater than 1 in 20 samples.	Yes
Accuracy

Satisfactory frequency/result for QC samples	The QC results are considered adequate for the purposes of the investigation.	Yes
Data from critical samples is considered valid	Data from critical samples is considered valid.	Yes
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted site assessment criteria	Appropriate laboratory analysis methods and detection limits were considered to have been achieved during the field and laboratory phases of this investigation.	Partial[1]

1. See discussion of DQI exceedances in **Section 7.2**.

9.1 QA/QC Discussion

9.1.1 Precision

Soil Duplicates

Two primary samples were split into intra and inter laboratory duplicate samples: JBMW03 8.0-8.2 (QA 9-4 and QC 9-4) and JBMW04 0.2-0.3 (QA 10-4 and QC 10-4). Duplicate sample analytical rates are presented as follows:

- QA 9-4 and QC 9-4 were analysed for TRHs and VOCs, at a rate 1 duplicate per 8 primary samples; and
- QA 10-4 and QC 10-4 were analysed for PAHs, at a rate of 1 duplicate per 4 primary samples;
- QA 10-4 and QC 10-4 were analysed for heavy metals, at a rate of 1 duplicate per 1 primary sample.

Concentrations of COPCs reported in intra and inter laboratory duplicate samples were within the acceptable limits of deviation from the primary samples for all analytes with the exception of the following:

- Cadmium: JBMW04 0.2-0.3 (0.6 mg/kg), QA 10-4 (1.8 mg/kg) and QC 10-4 (4.1 mg/kg). Cadmium exhibited an RPD of 100 % and 149 % between the primary and the intra and inter laboratory samples respectively;
- Mercury: JBMW04 0.2-0.3 (0.2 mg/kg), QA 10-4 (1.3 mg/kg) and QC 10-4 (0.6 mg/kg). Mercury exhibited an RPD of 147 % and 100 % between the primary and the intra and inter laboratory samples respectively;
- Nickel: JBMW04 0.2-0.3 (13.0 mg/kg) and QA 10-4 (32.0 mg/kg). Nickel exhibited an RPD of 84 % between the primary and the intra laboratory sample;
- Zinc: JBMW04 0.2-0.3 (370.0 mg/kg) and QA 10-4 (690.0 mg/kg). Zinc exhibited an RPD of 60 % between the primary and the inter laboratory sample; and
- Total PAHs: JBMW04 0.2-0.3 (1.4 mg/kg) and QA 10-4 (<0.5 mg/kg). Total PAHs exhibited an RPD of 95 % between the primary and intra laboratory sample.

The RPDs for the intra-laboratory and inter-laboratory duplicates are presented in **Appendix I** and are considered to be the result of heterogeneity in the fill material sampled at JBMW04 0.2-0.3. The elevated RPD results are considered to have no influence on the information used to make decisions identified in **Section 7.1.2.**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Groundwater Duplicates

Three primary groundwater samples were split into intra and inter laboratory duplicate samples: JBMW01 (QC20180416 and QA20180416),JBMW03 (QC20180416-1 and QA20180416-1) and PSM01 (QA151118 and QC15118). Duplicate sample analytical rates for COPCs are presented as follows:

- QC20180416 and QA20180416 were analysed for volatile TRHs, at a rate 1 duplicate per 7 primary samples;
- QC20180416, QA20180416, QA151118 and QC15118 were analysed for VOCs at a rate of 2 duplicates per 12 primary samples;
- QC20180416-1 and QA20180416-1 were analysed for semi-volatile TRHs, at a rate of 1 duplicate per 6 primary samples;
- QC20180416-1 and QA20180416-1 were analysed for heavy metals and PAHs at a rate of 1 duplicate per 1 primary sample; and

Concentrations of COPCs reported in intra and inter laboratory duplicate samples were within the acceptable limits of deviation from the primary samples for all analytes. The RPDs for the intra-laboratory and inter-laboratory duplicates are presented in **Appendix I**.

Soil Vapour Duplicates

Laboratory intra-laboratory duplicate samples were analysed at a rate of 2 duplicates per 9 primary samples. All intra-laboratory duplicates were reported to have an RPD of less than 50 A% except for QA-V (primary SV18), which was reported to have an RPD of 79 % for PCE. This elevated RPD is considered not to have affected the quality of the data set for the intended purpose, given the concentrations reported for this analyte were greater than two orders of magnitude above relevant assessment criteria.

Laboratory inter-laboratory duplicate samples were analysed at a rate of 1 duplicates per 9 primary samples. All inter-laboratory duplicates were reported to have an RPD of less than 50 %.

Laboratory Duplicates

All laboratory duplicates returned RPDs within the acceptable limits.

Summary of Precision

No indoor air duplicates were analysed as part of this assessment. Given the simplicity of the methodology employed to sample indoor air, there is limited potential to introduce field-based sampling errors, as demonstrated by analysis of the intra-laboratory duplicate sample. Laboratory duplicates, surrogate samples and laboratory control samples were recovered within the NATA accreditation limits, indicating limited potential for imprecision in analytical methods

Based on the above this minor deviation from the assessment DQOs is considered not to have substantially affected the quality of the data set for the intended purpose of the investigation. On this basis the DQIs for precision are considered to have been achieved for this investigation.

9.1.2 Accuracy

Surrogate spike recoveries were within the acceptable range of 70-130 % for all primary samples analysed, except for the following under-recoveries:

- PAH surrogate 2-Fluorobiphenyl was reported to be recovered at the following proportions: 58 % and 61 % (JBMW04 0.2-0.3) and 56 % (JBMW03); and
- VOC surrogate 4-bromofluorobenzene was reported to be recovered at a proportion of 61 % in sample SV15 – FRONT.

These deviations from the acceptance criteria were not considered to have an impact on the conclusions of this assessment as no PAH or VOC compounds were reported within one order of

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

magnitude of the assessment criteria for the samples to which the under-recoveries pertain. It is noted that all samples listed above were within the NATA acceptable limits of 50-150.

Laboratory control sample (LCS) recoveries were within the acceptable range of 70-130 % for all the analysed samples.

Matrix spike recoveries were within the acceptable range of 70-130 % within all primary samples analysed, except for zinc which was over recovered in one sample. The laboratory has noted that the over-recovery occurred in a sample which does not pertain to samples collected from the site.

On this basis the DQIs for accuracy are considered to have been achieved for this investigation.

9.1.3 Representativeness

Sample Holding Time

In general, extraction and analysis of samples was completed within the recommended holding times. It is noted that the following samples were extracted outside of holding times: JBMW03 (PAHs), JBMW03 2.0-2.1 (PAHs) and JBMW04 1.0-1.2 (VOCs and TRHs). The samples were extracted between 10 and 23 days outside of holding times. No contaminants were reported within the analysed samples above the laboratory limit of reporting. These sample results have been utilised as indicative data only, and have not been relied upon to make decisions identified in **Section 7.1.2**.

Rinsate Samples

A rinsate sample was collected following decontamination of all non-disposable sampling equipment for each day of the primary soil and groundwater sampling (totalling three rinsate samples). Analyte concentrations were generally not detected within the rinsate samples above the laboratory limit of reporting, with the exception of styrene, which was detected at a concentration of 0.001 mg/L in RINS (9-4-18). In absence of any potential site sources for styrene, and no detections of styrene above the laboratory limit of reporting within in any of the primary samples analysed, it is considered likely that this minor detection was the result of laboratory contamination. On this basis, no evidence for cross contamination between sample locations has been identified. Decontamination records are presented in **Appendix G**.

Trip Spike, Trip Blank and Laboratory Blank Samples

A trip spike was submitted with each laboratory batch for soil and groundwater samples collected during the assessment. Trip spike recoveries for analytes was within the acceptable limit of 70-130 %.

A trip blank was submitted with each laboratory batch for soil or groundwater samples collected during the assessment. There were no reported concentrations of BTEX compounds above the laboratory LOR.

All laboratory blanks analysed reported analyte concentrations less than the laboratory LOR.

The soil-vapour method blank sample, and ambient outdoor air 'background' sample, discussed below, have demonstrated that sample handling procedures did not adversely affect the reliability of the dataset for indoor air or soil-vapour.

Soil Vapour Representativeness

All soil vapour samples were analysed for the presence isopropyl alcohol to determine whether or not atmospheric interference had occurred during sampling. No detections of isopropyl alcohol were reported above the laboratory LOR.

Analysis of carbon tube samples was undertaken on the 'front' and 'back' of the tubes. In all cases, no constituents were reported in the 'back' of the tube which confirms that the carbon tubes were operated within the extent of soil vapour levels they can reasonable be considered to quantify.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Method Blank Samples

A method blank was submitted alongside the soil vapour samples. The method blank sample was prepared by drawing 25 L of ambient outdoor air at the site through a soil-vapour probe assembly prior to installation. Analysis of the method blank indicated that no COPCs were present above the laboratory limit of reporting.

Background Sample

A background sample was submitted alongside the 2nd round of ambient air samples (17 April 2018) which reported concentrations of COPCs below the adopted site investigation criteria. In addition, no target CEs were detected above the laboratory LOR. On this basis, the potential for contamination of samples as a result of sample handling procedures has not adversely affected the reliability of the dataset.

Decontamination Procedure

All field equipment was decontaminated appropriately as per the procedure identified in **Section 5.2.3**. Collected samples were immediately placed into the sample containers, sealed and then placed into chilled eskies to minimise volatile loss.

Sampling Methodology

Due to the presence of an obstruction in PSM03, a sample was required to be collected using a foot-valve. Foot-valve sampling may result in the disturbance and release of volatile chemicals from sample media, resulting in an underestimation of concentrations. Results from PSM03 for volatile constituents should be considered to be indicative only.

Summary of Representativeness

Based on the above comments, the DQIs for representativeness were considered to have been satisfactorily achieved.

9.1.4 Comparability

Eurofins, the primary laboratory (soil, groundwater and soil vapour), and Envirolab Services, the secondary laboratory (soil, groundwater and soil vapour) and primary ambient air laboratory, are NATA accredited for all analytical methods used. The laboratories used similar analytical methods and the analytical data were comparable between laboratories as indicated by the results of duplicate analysis.

The sampling methodology utilised for the assessment was consistent, as conducted by experienced JBS&G personnel in accordance with standard JBS&G sampling methods.

9.1.5 Completeness

All laboratory and field documentation is complete and correct. Chain of custody documentation is provided with laboratory reports in **Appendix H**. Bore hole logs are presented in **Appendix F**.

The frequency of analysis of all QA/QC samples was considered appropriate and valid.

9.1.6 Sensitivity

The adopted soil analytical methods provided suitable LORs for the purpose of making decisions identified in **Section 7.1.2**.

9.1.7 QA/QC Conclusions

The field sampling and handling procedures across the site produced QA/QC results which indicate that soil, groundwater and soil vapour data collected is of an acceptable quality.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The NATA certified laboratory reports indicate that the project laboratories were achieving levels of performance within its recommended control limits during the period when the samples from this program were analysed.

On the basis of the results of the field and laboratory QA/QC program, the soil data is of an acceptable quality upon which to draw conclusions regarding the environmental condition of the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

10. Results

10.1 Lithology and Soil Observations

Borehole drilling was conducted via mechanical drill rig on 9 and 10 April 2018 at the sample locations JBMW01 to JBMW04, shown on **Figure 3A**. Borehole logs are presented in **Appendix F**. The lithological and soil profiles observed were generally consistent with those previously encountered and described in **Section 4.2.3**.

As discussed in **Section 2.2** the site is almost entirely sealed by building footprints, concrete slabs and asphaltic pavements, with residual areas comprising garden beds and tree pits. Shallow fill material was encountered underlying hardstand pavements at JBMW01 (0 m – 1.2 m bgs), JBMW02 (0.3 m – 0.4 m bgs) and JBMW04 (0.1 m – 0.5 m bgs), comprising brown silty clay. Minor inclusions of slag were observed in the fill material at JBMW04.

Soils underlying fill material were generally silty and sandy mottled clays, varying in colour between orange, brown and grey. The encountered clays were noted to be very hard, exhibiting minor plasticity and considerable resistance to the drill rig. Within the clayey profile, bands of sand were observed, comprising approximately 0.9 m and 3.3 m of the soil profile in JBMW03 and JBMW04 respectively.

River gravels were encountered, overlying a weathered shale bedrock. All four boreholes were terminated on shale bedrock. The river gravel layer was noted to be heterogeneous in structure between locations, characterised as follows:

- JBMW01: sandy gravel – 6.50 m to 12.00 m bgl;
- JBMW02: gravelly sandy clay – 7.50 m to 11.50 m bgl;
- JBMW03: gravelly sand – 8.90 m to 12.10 m bgl; and
- JBMW04: gravelly clay – 7.50 m to 11.60 m bgl.

Soil samples were collected at regular (0.5 m to 1.0 m) intervals and analysed with a calibrated PID. PID readings ranged from 4.5 parts per million (ppm) to 14.3 ppm. No olfactory or visual indicators of volatile organic compound contamination were noted. Asbestos containing material, odours, staining or other indicators of potential contamination were not observed within the soil profile.

10.2 Soil Analytical Results

Detailed laboratory reports and chain of custody documentation are provided in **Appendix H**. Summarised soil analytical data from JBS&G (2017a) and the current assessment are presented in **Table A(1) Health Investigation Criteria** and **Table A(2) Ecological Investigation Criteria**. Statistical analyses undertaken on the data set are presented in **Appendix M** and are discussed in **Section 8.2.1** to **Section 10.2.6**.

Historical soil analytical data is presented for completeness. Where historically reported exceedances of the site criteria were noted in JBS&G (2017a), updated statistical analysis of the contaminant data set, incorporating current investigation results, has been undertaken to determine whether historical site investigation criteria exceedances are statistically significant in light of new data.

10.2.1 Heavy Metals

Individual heavy metal concentrations were generally reported at levels less than the adopted health and ecological based assessment criteria, with the following notable exceptions:

- Lead in soil concentrations reported in sampleJHA02 0.3-0.5 (910 mg/kg), exceeding the HIL-C criterion. Statistical analyses undertaken as part of JBS&G (2017a) indicated that this exceedance was not statistically significant exceedance of the site investigation criteria.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Incorporation of recent soil analytical data for lead to the statistical has indicated that the exceedances are not statistically significant based on the following:

- The maximum concentration is less than 250 % of the investigation criteria;
- The standard deviation of the data set is less than 50 % of the investigation criteria; and
- The 95 % UCL is less than the site investigation criteria.

- Copper in soil concentrations reported in sample JHA02 0.1-0.3 and JHA02 0.3-0.5 were 230 mg/kg and 200 mg/kg respectively, exceeding the site specific EIL criterion (179 mg/kg). Statistical analyses undertaken as part of JBS&G (2017a) indicated that these exceedances were not statistically significant. Incorporation of recent soil analytical data for copper to the statistical analysis has indicated that these exceedances are not statistically significant based on the following:
  - The maximum concentration is less than 250 % of the investigation criterion;
  - The standard deviation of the data set is less than 50 % of the investigation criterion; and
  - The 95 % UCL is less than the site investigation criterion.
- Zinc in soil concentrations reported in the blind and split duplicate samples of primary sample JBMW04 0.2-0.3, QA 10-3 (470 mg/kg) and QC 10-4 (690 mg/kg). The concentrations for zinc in soil reported exceeded the adopted EIL criterion (JHA02 0.1-0.3) and both the EIL-C and HIL-C criteria (JHA02 0.3-0.5). Statistical analyses undertaken on the dataset for concentrations of zinc in soil has indicated that these exceedances are not statistically significant exceedances of the site investigation criteria based on the following:
  - The maximum concentration is less than 250 % of the investigation criteria;
  - The standard deviation of the data set is less than 50 % of the investigation criteria; and
  - The 95 % UCL is less than the site investigation criteria.

10.2.2 Polycyclic Aromatic Hydrocarbons

Total PAH, B(a)P and carcinogenic PAHs as B(a)P Toxic Equivalence Quotient (TEQ) values for the analysed samples were generally reported at concentrations less than the adopted site assessment criteria, except for the concentration of B(a)P at location JHA02 0.3-0.5 (0.9 mg/kg), which exceeded the adopted ESL for the Residential and Public Open Space' land use scenario. Statistical analysis of the dataset for concentrations of B(a)P in soil, incorporating current investigation data, indicated that this concentration did not comprise a statistically significant exceedance of the site criterion.

10.2.3 Total Recoverable Hydrocarbons

Concentrations of all TRHs were generally reported below the adopted health and ecological site assessment criteria in soil samples selected for analysis. TRH Fraction C_{10}-C_{16} was detected in sample JB11 0.05-0.1 at a concentration of 710 mg/kg, exceeding the ESL for Residential and Public Open Space criterion. Statistical analyses undertaken on the dataset for concentrations of TRH Fraction C_{10}-C_{16} in soil has indicated that this exceedance is not statistically significant based on the following:

- The maximum concentration is less than 250 % of the investigation criteria;
- The standard deviation of the data set is less than 50 % of the investigation criteria; and
- The 95 % UCL is less than the site investigation criteria.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

10.2.4 Volatile Organic Compounds

Concentrations of all VOCs were reported to be below the adopted site investigation criteria. It is noted that chlorinated ethenes were detected above the laboratory limit of reporting in samples JHA04 0.2-0.4 (PCE – 3.7 mg/kg) and JHA04 0.6-0.8 (PCE 0.6 mg/kg and TCE 0.7 mg/kg).

10.2.5 Total Organic Carbon

Two samples of soils from the saturated horizon were collected from JBMW05 and submitted for analysis of total organic carbon content. Concentrations were reported between 0.1 % (clay soils – MWSV 6.9-7.0) and 0.4 % (gravelly clay soils- MWSV 7.9-8.0).

10.3 Groundwater Field Observations

Three groundwater monitoring events (GMEs) were conducted on the site and surrounding area (16 April, 15 and 21 November 2018). A summary of groundwater conditions encountered during the GMEs is presented in **Table 10.1**, **Table 10.2** and **Table 10.3** below. Groundwater monitoring well locations are provided on **Figure 4B**. **Figure 4B** also shows inferred groundwater contours based on the encountered groundwater levels (m AHD), topographical and hydrological features of the site. Field sheets recorded during the GME are presented in **Appendix J.**

A registered surveyor was engaged to determine the position of groundwater monitoring wells (PSM01 to PSM03 and JBMW01 to JBMW04) sampled as part of the first GME. The surveyor utilised real-time kinematic global navigation satellite system for latitudinal and longitudinal positioning in conjunction with differential levelling for well heights. The surveyors report is provided in **Appendix K**.

Groundwater levels were obtained during groundwater well installation and during sampling. The water levels encountered are presented in **Appendix F** and **Appendix J**. It is noted that, due to variable and generally low hydraulic conductivity of the target aquifer, the standing groundwater levels observed during installation and sampling of the wells were considered unrepresentative of the groundwater system. As a result, a subsequent gauging activity was undertaken, on 3 May 2018, on PSM01 to PSM03 and JBMW01 to JBMW04 following the initial GME. Stabilised standing water levels were recorded, and groundwater flow direction calculations based on these levels. The stabilised standing water levels are presented in **Table 10.1**.

Table 10.1 Groundwater Geospatial Characteristics

Well Reference	Easting (MGA56)	Northing (MGA56)	Surface Level (m AHD)	Top of Pipe (m AHD)	Depth to Standing Water Level (m bTOC)	Standing Water Level (m AHD)

10.4 Groundwater Analytical Results

Detailed laboratory reports and chain of custody documentation are provided in **Appendix H.** Summarised groundwater analytical data for COPCs are presented in **Table B**. The results are discussed in **Section 10.4.1** to **Section 10.4.4**.

Where historically reported exceedances of the site investigation criteria were noted in JBS&G (2017a), they have been discussed in alongside the current analytical data.

10.4.1 Metals

A groundwater sample collected from JBMW03 (16 April 2018) and analysed for concentrations of heavy metals. Heavy metals concentrations within the analysed samples were generally reported to be below the adopted site assessment criteria with the exception of the following:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- JBMW03 (16 April 2018): 0.034 mg/L, exceeding the ANZAST (2018) and NWQMS (2011) criteria; and
- JBMW03 (16 April 2018): 0.024 mg/L, exceeding the ANZAST (2018) criterion.

10.4.2 Total Recoverable Hydrocarbons

Groundwater samples from wells JBMW01, JBMW02, JBMW03, PSM01[28], PSM02 and PSM03 were analysed for concentrations of TRHs. TRHs were generally not detected above the laboratory LOR, with the exception of the following:

- JBMW02 (16 April 2018): 0.15 mg/L (C_6-C_{10});
- PSM01 (16 April 2018): 0.04 mg/L (C_6-C_{10}); and
- PSM02 (16 April 2018): 0.02 mg/L (C_6-C_{10}).

10.4.3 Benzene, Toluene, Ethylbenzene and Xylene

All groundwater samples collected over the three GMEs were submitted for analysis of VOCs including BTEX compounds. BTEX concentrations were reported to be less than the site investigation criteria and generally less than the laboratory LOR. Trace level detections were reported in the following samples:

- PSM01 (16 April 2018): 0.001 mg/L toluene; and
- PSM02 (16 April 2018) 0.002 mg/L toluene.

10.4.4 Polycyclic Aromatic Hydrocarbons

A groundwater sample collected from monitoring well JBMW03 and analysed for concentrations of PAHs. PAH concentrations within the analysed sample were all below the adopted site assessment criteria and laboratory LOR.

10.4.5 Volatile Organic Compounds

All groundwater samples collected over the three GMEs were submitted for analysis of VOCs. VOCs were generally reported to be at concentrations below the adopted site assessment criteria with the following notable exceptions:

- JBMW02 (16 April 2018): 0.15 mg/L PCE, exceeding the ANZAST (2018) and NWQMS (2011) assessment criteria;
- JBMW02 (15 November 2018): 0.073 mg/L PCE, exceeding the ANZAST (2018) and NWQMS (2011) assessment criteria;
- JBMW05 (15 November 2018): 0.12 mg/L PCE, exceeding the ANZAST (2018) and NWQMS (2011) assessment criteria; and
- PSM01 (16 April 2018): 0.06 mg/L PCE, exceeding the NWQMS (2011) assessment criterion; and
- PSM01 (26 May 2018): 0.054 mg/L PCE, exceeding the NWQMS (2011) assessment criterion.

The following compounds were detected above the laboratory limit of reporting, where high reliability ANZAST (2018) criteria are not provided, for the purpose of screening, the concentrations have been compared against low reliability criteria (ANZAST 2018) and the Region 9 RSLs (US EPA 2018):

- 1,2,4-trimethyl benzene: 0.003 mg/L in PSM02 (2017). No low reliability criterion is provided for this compound, this concentration is below the RSL (0.56 mg/L);

[28] Fraction C_6-C_{10} only.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- 1,3,5-trimethyl benzene: 0.001 mg/L in PSM02 (2017). No low reliability criterion is provided for this compound, this concentration is below the RSL (0.6 mg/L);
- 2-Propanone (Acetone): 0.021 mg/L in PSM01 (2017) and 0.01 mg/L in PSM02 (2018). No low reliability criterion is provided for this compound, this concentration is below the RSL (1.8 mg/L);
- Cis-1,2-dichloroethene: 0.002 mg/L in JBMW02 (2018). This concentration is below the low reliability criterion for freshwater (0.7 mg/L, ANZAST 2018); and
- 2-butanone: 0.003 mg/L in JBMW02 and 0.012 mg/L in PSM02. No low reliability criterion is provided for this compound, this concentration is below the RSL (1.2 mg/L).

10.4.6 Natural Attenuation Parameters

Three samples of groundwater (PSM01, JBMW02 and JBMW05 – 15 November 2018) were analysed for natural attenuation parameters. Results are presented following:

Dissolved Gases

- Ethane was not detected above the laboratory LOR in any of the analysed samples;
- Ethene was detected at 0.1 mg/L in JBMW02 and JBMW05, and was not detected in PSM01; and
- Methane was detected in PSM01 at a concentration of 0.78 mg/L, in JBMW02 at 0.09 mg/L and not detected at JBMW05.

Physiochemical Parameters

- Ferrous Iron ranged from less than the laboratory limit of reporting to 1.7 mg/L;
- Nitrate ranged from less than the laboratory limit of reporting to 1.2 mg/L;
- Sulphate ranged from 59 to 280 mg/L;
- Chloride ranged from 2800 to 2900 mg/L;
- Alkalinity ranged from 400 to 620 mg/L;
- pH was measured between 6.5 and 8.2 pH units; and
- Organic carbon ranged from 2 mg/L to 28 mg/L.

10.5 Soil Vapour Field Observations

The first soil vapour sampling event was undertaken on 17 April 2018. The sampling event comprised installation of seven new sub-slab soil vapour probes. The soil vapour probes were installed and sampled in accordance with the methodology presented in **Section 7.5**. An example sub-slab soil vapour probe installation diagram is presented in **Appendix F**, alongside soil borehole and groundwater monitoring well logs. Installation details are also provided in **Appendix F**.

The soil vapour sampling event was conducted during a low-pressure system. The recorded weather conditions are presented in **Appendix L**. Over the period of sampling, a decrease in ambient temperature was noted to coincide with a south/south-easterly wind.

The second soil vapour sampling event was undertaken on 15 November 2018. The sampling event comprised the sampling of two off site soil vapour wells (SV18 and SV19) on the northern side of Henry Street. The soil vapour wells were installed between 4.7 and 5.0 m bgs. Installation details are provided in **Appendix F**.

A multi-gas meter was utilised to conduct leak tests at an approximate rate of 300 mL/minute. Sampling of the probes was undertaken by low-flow air pump method, calibrated to 100 mL/minute, and sampled for a period of one hour (total volume 6 L).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

10.6 Soil Vapour Analytical Results

Detailed laboratory reports and chain of custody documentation are provided in **Appendix H**. Summarised soil analytical data for COPCs are presented in **Table C**. Concentrations of contaminants within soil vapour were converted from total mass values provided within laboratory documentation via the application of conversion factor as shown below.

$$Concentration\ in\ \frac{mg}{m^3} = \frac{laboratory\ result\ (in\ \mu g)}{(6\ or\ 24)\ L\ sample\ volume}$$

Concentrations of VOCs were generally reported to be below the laboratory LOR and the relevant site assessment criteria. The following chlorinated solvents were reported to have been detected within the carbon media at masses which correspond to vapour concentrations in exceedance of the site assessment criteria for sub-slab locations on the site:

- PCE was detected in SV14 at a mass of 1000 µg within the carbon medium, corresponding to a soil vapour concentration of 42 mg/m^3 (HIL-A, HIL-B and HIL-C); and
- TCE was detected in SV14 at a mass of 69 µg within the carbon medium, corresponding to a soil vapour concentration of 2.88 mg/m^3 (HIL-B, HIL-C and HIL-D);
- TCE was detected in SV16 at a mass of 4.2 µg corresponding to a soil vapour concentration of 0.168 mg/m^3 (HIL-B and HIL-D); and
- In addition to the above, PCE was detected in SV11 and SV16 at masses of 4 µg and 38 µg, corresponding to soil vapour concentrations of 0.17 mg/m^{3}and 1.58 mg/m^3.

Offsite soil-vapour wells sampled (SV18 and SV19) were reported to be generally absent VOCs, with the notable exception of the following:

- PCE was detected in SV18 (367 mg/m^3) and SV19 (1300 mg/m^3), exceeding the HIL-B, HIL-C and HIL-D criteria by one to two orders of magnitude; and
- TCE was detected in SV18 (1.62 mg/m^3) and SV19 (8.83 mg/m^3), exceeding the HIL-B, HIL-C and HIL-D criteria by one to two orders of magnitude.

Trace detections of the following compounds were also detected within SV18 and SV19:

- Chloroform was detected in SV18 (0.28 mg/m^3) and SV19 (0.33 mg/m^3);
- Toluene was detected in sample SV18 (0.167 mg/m^3), less than the adopted HSL-D criteria (NEPC 2013); and
- Xylene was detected in sample SV18 (0.417 mg/m^3), less than the adopted HSL-D criteria (NEPC 2013).

10.7 Indoor Air Observations

Indoor air sampling events were undertaken on 9, 17 April, 3 May and 15 November 2018. The sampling events comprised collection of indoor air samples from locations shown on **Figure 4D.** On 9 and 17 April 2018, samples were taken from four locations: DC_SHOP, DC_BATH, 140_SHOP and 140_BATH. An additional sample was collected from 140_SHOP on 3 May 2018. A background sample was taken from location 'Ambient Outside' on 17 April 2018. On 15 November 2018, samples were collected from two locations: 2/134_SHOP, 140_SHOP_2. An additional sample was also collected at location 140_SHOP. Descriptions of the locations are provided as follows:

- DC_SHOP: upon a shelf within the general shop floor of Shop 3/134-138 Henry Street;
- DC_BATH: ground surface level of an enclosed water closet, connected to sewerage infrastructure of Shop 3/134-138 Henry Street;
- 140_SHOP: upon a shelf within Shop 3/140 Henry Street;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- 140_BATH: ground surface level of an enclosed water closet, connected to sewerage infrastructure of Shop 3/140 Henry Street;
- 140_SHOP_2: upon a shelf within the massage room of Shop 3/140 Henry Street;
- 2/134_SHOP: upon a shelf within the café located at Shop 1 138/134 Henry Street; and
- Ambient Outside: ground surface level of a secured, outside area adjacent to Shop 3/134-138 Henry Street.

The recorded weather conditions, in addition to graphed temperature and pressure differentials, are presented in **Appendix L**. The indoor air sampling events were conducted during the following atmospheric conditions:

- 9 April 2018: Hot conditions/large pressure differential. During the sampling period, it was noted that both premises assessed were being cooled with air conditioning units;
- 17 April 2018: Representative conditions. It is noted that this sampling event was meant to coincide with a large pressure differential, which is usually indicated by a predicted southerly wind. The reported pressure differential was not representative of 'worst-case' conditions; and
- 3 May 2018: Hot conditions/large pressure differential. During the sampling period, it was noted that both premises assessed were being cooled with air conditioning units.
- 15 November 2018: Hot conditions/large pressure differential. During the sampling period it is noted that a large storm front formed in the second half of the day.

10.8 Indoor Air Analytical Results

Detailed laboratory reports and chain of custody documentation are provided in **Appendix H**. Summarised soil analytical data for COPCs are presented in **Table D**. Indoor air concentrations were generally noted to be below the adopted site investigation criteria, with the exception of TCE in sample 140_SHOP (9 April 2018). TCE was reported at a concentration of 20 µg/m^3, exceeding the adopted site investigation criterion.

A statistical analysis of the data set was undertaken, which comprised calculation of an average TCE in indoor air concentration across the three sampling events at 140_SHOP. Utilising a value of half the laboratory LOR where the no detection above LOR was reported, the average value for TCE within at this location is 6.93 µg/m^3, which is below the adopted site investigation criterion.

However as discussed further in **Sections 11.1.4** and **12**, it is not considered that the high level of TCE reported is consequent of sub-surface impact at the site, and the slight exceedance as based on this spurious result is not a sufficient basis to warrant intervention and/or management actions in the near term.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

11. Contaminant Distribution Summary

Based on information collected in the desktop and field investigations in conjunction with laboratory analytical data, the distribution of contaminants is discussed in **Section 11.1** to **Section 11.3**.

11.1 AEC 1 Former Dry Cleaner

Soil, soil vapour and groundwater samples obtained during the DSI (JBS&G 2017a) and the current investigation indicate that the greatest levels of chlorinated ethene impact is in the immediate vicinity 134-138 Henry Street and extending north and west of the premises. Detections of contaminant concentrations a considerable distance west of the premises provide evidence that the compounds may have migrated along the inferred sewerage infrastructure alignment. Impacts to site media are detailed in **Section 11.1.1** to **Section 11.1.3**

11.1.1 Soil Impacts

Soil samples analysed as part of the previous (JBS&G 2017a) and the current investigation have not identified gross and/or widespread soil contamination. No soil samples analysed within the groundwater table, or nearby to sewerage infrastructure were reported to contain COPCs above the laboratory limit of reporting. Minor concentrations of PCE and TCE at location JHA04, underlying Shop 3/140 Henry Street, were reported in JBS&G (2017a).

Notwithstanding, it is considered likely that soils surrounding the sewerage infrastructure, and underlying the dry cleaner, have historically been impacted by dry cleaning solvents. The maximum levels of TCE reported in sub slab vapour are consistent with a source of chlorinated ethene being present in the unsaturated zone. Chlorinated ethenes can commonly be heterogeneously distributed through a soil profile, and localised within the extent of a sample of soil collected in clay based soils. Due to their complex partitioning characteristics subsurface chlorinated ethene impacted soils are not typically readily identified. Impacted soils are considered to potentially represent an ongoing source of contamination to both groundwater and soil vapour.

11.1.2 Groundwater Impacts

Groundwater analytical results indicated that PCE was present at concentrations exceeding the investigation criterion at JBMW02 and JBMW05, and above the laboratory limit of reporting in JBMW03, PSM01 and PSM03. Chlorinated ethenes were not detected in samples of groundwater collected from JBMW01, JBMW04, JBMW06, JBMW07 or PSM02. . Trace concentrations of TCE in groundwater were reported at locations JBMW02 (0.002 mg/L to 0.009 mg/L), JBMW05 (0.002 mg/L) and PSM01 (0.001 mg/L).

It is noted that JBMW02 and JBMW05 are over the northern boundary of the site, providing evidence that the impact has migrated off the site via the groundwater. No groundwater monitoring wells have been installed directly into the chlorinated ethene impact source zone, although it is considered likely that the highest concentrations of chlorinated ethenes will be present directly underneath the dry cleaner.

Impacts to groundwater have been delineated north (JBMW06 and JBMW07), east (JBMW03), south (PSM02) and west (JBMW01 and JBMW04). Potential remains for groundwater impact to be present further northwest of JBMW05.

11.1.3 Soil vapour Impacts

<u>Shallow Soil Vapour</u>

Results obtained from the current investigation have shown that significant concentrations of PCE and TCE are present within shallow soil vapour (<0.3 m bgl) surrounding the dry cleaner. Soil vapour contaminant samples collected from locations SV11, SV14 and SV16 were reported to have concentrations of CEs above the laboratory limit of reporting. The highest results reported during the current assessment were associated with location SV14, which was placed immediately overlying

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

sewerage infrastructure servicing the dry cleaner. Soil vapour samples collected from locations SV12, SV13, SV15 and SV17 were not reported to have any VOCs above the laboratory limit of reporting.

Within samples where both TCE and PCE were detected above the laboratory LOR, the ratio of PCE/TCE ranged from 4.143 to 14.49.

The distribution of CEs in soil vapour has provided evidence that the compounds have migrated within/alongside the sewerage infrastructure a considerable distance from the dry cleaner (>50 m). In addition, impacted soil vapour may be migrating over the northern boundary of the site, as indicated by elevated concentrations in SV11.

The investigation results indicate that the occurrence of CEs in shallow soil-vapour is not strongly correlated with presence in groundwater. Whilst volatilisation of CEs from groundwater is likely to be occurring, it is considered unlikely that it is occurring at a level which represents a risk to future site users on the basis of the following considerations.

- SV09 contained no soil vapour concentrations above the laboratory LOR with elevated underlying groundwater impact (PSM01, 0.033 mg/L to 0.059 mg/L);
- The largest groundwater impact (JBMW02) was near two soil-vapour sample locations which were reported to contain minimal concentrations (SV11) to no detection (SV12) of CEs in soil-vapour were present;
- SV16 contained elevated concentrations of CEs with no underlying groundwater impact (JBMW04), and the highest reported soil vapour impact is overlying adjacent to the sewerage infrastructure (SV14); and
- Groundwater is in excess of 7 m below the current ground surface.

Deep Soil Vapour

Two deep soil vapour samples were taken north of the former dry cleaner (SV18 and SV19). Samples were collected from 4.7 m to 5.0 m below ground levels. Highly elevated CEs were detected in both samples, exceeding interim HILs:

- SV18: PCE (367 mg/m^3) and TCE 1.62 (mg/m^3); and
- SV19: PCE (1300 mg/m^3) and TCE 8.83 (mg/m^3).

These results are indicative of the presence of contamination at beneath/adjacent to the former dry cleaners at depth. The relatively low concentrations in groundwater indicate that the deep source is unlikely to be present in the saturated zone. Additional assessment will be required to determine whether offsite soil-vapour impacts require specific consideration as part of remediation of the PCPV site.

11.1.4 Indoor Air

Indoor air was sampled over four monitoring events (9 and 17 April 2018, 3 May 2018 and 15 November 2018). Samples analysed from Shop 3/134-138 Henry Street and Shop 3/140 Henry Street have indicated that the PCE is present within the indoor air of both premises. TCE was generally not detected above the laboratory limit of reporting in the analysed samples, with the notable exception of 140_SHOP on 9 April and 3 May 2018. **Table 11.1** and **Table 11.2** show ratios of indoor air to sub-slab vapour concentrations, and relative PCE to TCE concentrations within samples.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 11.1 Indoor Air and Sub-Slab VOC Concentrations

Sample Location	Highest Indoor Air Concentration (µg/m³)	Closest Sub-Slab Soil Vapour Concentration (µg/m³)	Indoor Air to Sub-slab Soil Vapour Ratio
Tetrachloroethene			
140_BATH	<3	14 500 (SV10)	<0.00021
140_SHOP	5	14 500 (SV10)	0.00035
DC_BATH	8	40 000 (SV14)	0.00020
DC_SHOP	8	40 000 (SV14)	0.00020
Trichloroethene			
140_BATH	<2.7	3500 (SV10)	<0.00077
140_SHOP	20	3500 (SV10)	0.00571
DC_BATH	<2.7	2760 (SV14)	<0.00098
DC_SHOP	<2.7	2760 (SV14)	<0.00098

Table 11.2 PCE to TCE Ratio in Site Media

Sample Location	Highest PCE Concentration (µg/m³)	Highest TCE Concentration (µg/m³)	Ratio of PCE/TCE	Approximate Distance From Shop 3/140 Henry Street / Distance From Shop 3/134-138 Henry Street (m)
Indoor Air				
140_BATH	<3	<2.7	-	Internal
140_SHOP	5	20	0.250	Internal
DC_BATH	8	<2.7	>2.963	Internal
DC_SHOP	8	<2.7	>2.963	Internal
Sub-Slab				
SV05	56 667	9333	6.072	<5 / 20
SV10	14 500	3500	4.143	Underlying / 15
SV14	40 000	2760	14.49	Boundary / < 5
SV16	1520	168	9.047	30 / 40

One reported concentration of TCE within indoor air sample 140_SHOP, 9 April 2018 (20 µg/m³), was inconsistent with the subsequent three samples taken at the same location, 17 April 2018 (<2.7 µg/m3),3 May 2018 (5 µg/m³) and 15 November 2018 (<2.7 µg/m³).

The ratio between TCE and PCE in this indoor sample was significantly different to all sub-slab soil vapour samples in which both TCE and PCE were detected. On this basis, the elevated concentration is considered likely to be the result of an additional, internal source within the premises, and is not considered to be reflective of CE advection from the sub-slab soil vapour.

11.2 AEC 2 Former Service Station

Environmental media samples analysed as part of the previous (JBS&G 2017a) and the current investigations have provided evidence that gross and/or widespread contamination as a result of the former service station operation has not occurred.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Soil samples analysed from JBMW03, JHA04 and JHA06 were reported to have concentrations of TRHs below the adopted site investigation criteria. Soil vapour samples analysed from four locations surrounding the premises were reported to have concentrations of TRHs and BTEX compounds below the laboratory LOR or the site investigation criteria. No TRHs, PAHs or lead in groundwater above the laboratory LOR were reported at JBMW03. If any impacts to soil, groundwater or soil vapour have occurred as a result of the operation of the former service station, it is considered likely that they will be limited to minor, localised hotspots.

11.3 Additional Contamination Issues

Additional known and potential contamination issues identified are detailed in **Section 11.3.1** to **Section 11.3.3**.

11.3.1 Soil Impacts

Minor impacts to soils have previously been identified (JBS&G 2017a): elevated nickel, lead and TRHs in fill material. With consideration of soil analytical data obtained in the current assessment, total soil contaminant concentrations reported in JBS&G (2017a) are not considered to represent statistically significant exceedances of the site investigation criteria. The potential for leachability of lead from fill material at JHA02 is discussed in **Section 12.5.**

With the exception of the above, and impacts discussed in **Section 11.1.1**, soils at the site are considered to be generally free from contamination. No odours, staining or asbestos were observed in any of the historical or current investigation locations. It is noted that the character of soils underlying existing building footprints, and underlying the four onsite transformers, has not yet been determined. Additionally, given the limitation of soil investigations via boreholes, there is the potential for asbestos impacts to be present within soils that have not yet been identified.

11.3.2 Groundwater Impacts

JBS&G (2017a) reported elevated concentrations TRHs in PSM01, PSM02 and PSM03, as well as elevated toluene in PSM01. Analytical results from the current investigation have indicated that these compounds were either not detected above the laboratory LOR or detected at substantially lower concentrations. It is considered that these compounds may have been associated with drilling advancement fluids employed as part of the geotechnical drilling methodology utilised for the installation of these wells, rather than be present with in the local groundwater system beyond the monitoring well.

Analysis of heavy metals within JBMW03 has identified arsenic and nickel at concentrations exceeding the adopted site criteria. The potential risks associated with elevated metals in JBMW03 are discussed in **Section 12.5**.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

12. Discussion

Based on the decision-making process established in **Section 7.1.2**, the decisions required to be made are discussed below. The discussion has been split between current site users under an ongoing commercial/industrial land use, as identified during the site investigation, and the future land use under the future Penrith City Park proposal.

12.1 Potential Risks to Future Onsite Receptors

The potential risk to current and future site users posed by site media is discussed in **Section 12.1.1** to **12.1.3** below**.**

12.1.1 Soils

No statistically significant exceedances of the commercial/industrial site investigation criteria for COPC concentrations in soil were reported in any of the analysed samples. Chlorinated ethene impacts are considered likely to exist within soils surrounding sewerage infrastructure and in the vicinity of the dry cleaner. Risks to future site users as a result of the presence of soil-bound CEs are discussed in **Section 12.1.2** and **12.1.3.**

Notwithstanding, the potential remains that minor/localised impacts exist underlying the building located at 118 Henry Street (The Service Station, AEC 2), near onsite electrical transformers (AEC 3) and within shallow fill material across the site. Whilst hardstand surfaces are maintained at the site, the potential presence of unidentified ACM in shallow fill material is considered not to represent a substantial risk to site users. Consideration of these potential impacts should be made prior to any site maintenance/redevelopment activities which may result in disturbance of soils within these AECs, as discussed in **Section 12.6**.

12.1.2 Groundwater

Groundwater at the site is impacted by VOCs (primarily PCE and TCE) and heavy metals (primarily arsenic and nickel). Given the absence of identified groundwater bores, aesthetic concerns noted in **Section 12.4**, and the salinity of the groundwater, no potential for utilisation of site groundwater as a drinking water source exists or is expected to exist at the site. In addition, no onsite ecological receptors of groundwater impacts currently exist at the site. A discussion of potential risks to offsite groundwater receptors is provided in **Section 12.5**.

On this basis, exceedances of the NHMRC (2017) drinking water criteria and the ANZAST (2018)disturbed ecosystem criteria do not warrant further consideration pertaining to the assessment of risks to future/current site receptors. Potential beneficial reuse of groundwater will be considered within the site management strategy.

12.1.3 Soil Vapour

Comparison of sub-slab soil vapour VOC concentrations with the adopted site investigation criteria indicate that there is a potential risk to site users within the buildings located at 134-138 (The dry cleaner) and 140 Henry Street, Penrith. Additionally, a sub-slab soil-vapour concentration in exceedance of the site assessment criteria was reported at location SV16, overlying sewerage infrastructure at the rear of 144 Henry Street Schedule B(7) of the NEPM (NEPC 2013) notes that the interim soil vapour HILs derived for VOCs under a commercial/industrial land use scenario are conservatively based on a sub-slab to indoor air attenuation factor of 0.1 and do not account for factors such as contaminant sorption, transformation and degradation. Further, JBS&G assessment of sub-slab to indoor air attenuation to other buildings within the Sydney metropolitan region for these constituents has demonstrated that the factor of 0.1 is highly conservative.

It is noted that trace detections of chloroform at 4.7-5.0 m bgs were reported at SV18 and SV19. In the absence of any EPA endorsed criteria for screening level criteria for chloroform in soil-vapour, JBS&G made a qualitative assessment on potential risks to site users. Based on the depth to the

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

location of the identified chloroform, absence from surface level soil vapour and absence from indoor air samples across the site, these detections are considered unlikely to represent a potential risk to current/future site users.

Consistent with NEPC (2013), indoor air sampling is the most direct approach for the quantification of inhalation exposure for VOCs. Significant limitations are stated within NEPC (2013) pertaining to the process of derivation for the sub-slab Interim VOCC HILs. As such, indoor air concentrations for these compounds are more appropriate for consideration of risks to current site users. On this basis, determination of risks posed to current site users at the premises due to the presence of COPCs in sub-slab soil vapour was based on the results of the indoor air assessment only as discussed in **Section 12.1.4**.

Sub-slab soil vapour VOC concentrations were further compared against site investigation criteria for the proposed land uses under the Penrith City Park development. Comparison of concentration data indicated that COPCs were generally present at concentrations significantly below the site investigation criteria, apart from impact at locations SV05 and SV14. Concentrations of PCE and TCE were reported in soil-vapour in exceedance of the HIL-C VOCC site investigation criteria. A potential risk to future site users exists within this portion of the proposed Penrith City Park development.

The PCPV development may potentially include multi-level basements within the high-density residential/commercial areas (**Figure 2**). Assessment of shallow soil-vapour surrounding 118 Henry Street indicates that there are no vapours present within shallow soils of the future high density residential/commercial areas. However, the potential remains for soil-vapour impact to be present at depth at concentrations which may represent a risk to occupants of future basements if not appropriately managed.

Where multi-level basements are proposed, confirmation that soil-vapour impacts are absent over the depth profile will be required to determine that no risks are present to future basement occupants.

12.1.4 Indoor Air Assessment

Review of indoor air analytical data from the premises located at 134-138 and 140 Henry Street has indicated that, whilst soil-vapour COPCs are present at concentrations which exceeded interim HIL-D VOC site assessment criteria, the contaminants are not migrating into the indoor air environment at a rate resulting in risks to the site occupants.

It is noted that a concentration of TCE reported at 140_SHOP varied significantly, with one reported concentration exceeding the site investigation criterion. Three repeat samples returned values less than the site investigation criterion, and generally less than the laboratory limit of reporting. It is considered likely that the elevated concentration is attributable to an onsite/indoor source which wasn't able to be located during the site inspection.

Where this peak level was consequent of a sub-surface soil vapour source, it would have been reasonably anticipated that PCE would have occurred with the TCE in the indoor air sample. PCE has been reported at higher concentrations than TCE in the all impacted soil vapour samples. PCE has reasonably similar chemical properties to TCE which would indicate it would be as likely to occur within indoor air. The absence of a significant level of PCE in the most impacted indoor air concentration is strongly indicative of an indoor (non-site contamination) related source of TCE being present within the building which has interfered with the sample.

Consistent with NEPC (2013), indoor air concentrations measured may be affected by temporal and spatial variability and background sources. On this basis, and given the identified exceedance of the adopted site investigation criterion, to determine the potential for risk for current site users within Shop 3/140 Henry Street, additional indoor air monitoring should be undertaken.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

12.2 Background Soil Contamination

Metals concentrations within natural soil samples analysed were within published background ranges as detailed in **Section 6.2.1**.

12.3 Chemical Mixtures

Soil vapour samples analysed at locations SV04, SV05, SV10, SV11, SV14, SV16, SV18 and SV19 were reported to have concentrations of both PCE and TCE above the adopted site assessment criteria. The exposure pathway (inhalation) and physiological effects of these contaminants is similar and this may have compounding detrimental effects to the health of future site users. However, it is generally accepted that there is sufficient conservatism in the assessment criteria presented to account for potential effects of chemical mixtures particularly for contaminants that commonly occur together.

There were no soil or groundwater samples analysed which indicated the presence of a chemical mixture requiring further consideration.

12.4 Aesthetic Issues

No visible ACM, odours, stains or other sources of aesthetic concern under the current or proposed land uses were observed during the soil or soil vapour investigation.

12.5 Potential Offsite Migration of Contaminants

The potential for offsite migration of VOCs was assessed via sampling/analysis of boundary groundwater monitoring wells and temporary sub-slab soil vapour probes. Additionally, offsite migration of impact was assessed via installation and sampling of downgradient soil vapour and groundwater monitoring wells.

Identification of significant concentrations of VOCs in offsite vapour and groundwater wells has indicated that offsite migration of contamination from the site has occurred.

The sewerage infrastructure on the site has been identified to present a preferential pathway for VOCs. Given analytical data for soil vapour concentrations along the service line infrastructure were below the adopted site investigation criteria, it is considered unlikely that offsite migration via the sewerage infrastructure is occurring at a level requiring further consideration. Notwithstanding, the potential for offsite migration via sewerage infrastructure is required to be addressed as part of the site management strategy.

As discussed in **Section 11.1.1**, it is considered likely that soils underlying the dry cleaner and soils nearby to impacted sewerage infrastructure represent an ongoing source of contamination to groundwater and soil vapour at the site. Currently, this area is almost completely capped by hardstand pavements and/or building footprints which limit the extent of surface and rainwater infiltration. It is understood that the proposed redevelopment will comprise demolition of existing hardstand pavements and site structures, exposing previously capped materials to rainwater infiltration. On this basis, management of these soils is required, as discussed in **Section 12.6**.

JBS&G considers remedial works are required to make the site suitable for the intended purpose and, as such, all ongoing sources of contamination to that pose a potential risk to offsite receptors will be removed from the site.

12.5.1 Groundwater

Groundwater impacts were identified in two samples obtained from offsite monitoring wells (JBMW02 and JBMW05) marginally in exceedance of ANZAST (2018) and NHRMC (2011) assessment criteria confirming that groundwater impact has migrated from the site in a north-westerly direction.

No positive detections of VOCs were reported in samples obtained from wells to the north of the site (JBMW06 and JBMW07) or to the west of the dry cleaner (JBMW01 and JBMW04). A trace level

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

detection of PCE was reported in JBMW03. The absence of significant groundwater within these samples indicates that impacted groundwater migration is limited to the northwest of the dry cleaner, consistent with the inferred groundwater flow direction (**Section 10.3**). The north-westerly extent of the groundwater plume is not currently known.

The highest reported chlorinated ethene concentration (JBMW02, 0.15 mg/L) is approximately two times the ANZAST (2018) criterion for 95 % protection of fresh water aquatic species. Trace concentrations of VOCs for which no freshwater aquatic criteria are available were also detected at JBMW02. The VOCs reported in offsite groundwater are unlikely to pose an ecological risk to the identified receptor as significant attenuation dilution occurs between the site and the river (noting that the groundwater fluid electrical conductivity/total dissolved solids is approximately an order of magnitude higher than occurs in the Nepean River at Penrith). On this basis, potential risks to sensitive offsite groundwater receptors are not considered significant. Further, given the contaminating land use has now ceased, it is anticipated that offsite groundwater concentrations will diminish over time via natural attenuation processes.

12.5.2 Soil Vapour

No exceedances of the site assessment criteria for VOCs in soil vapour were identified within sub-slab samples on the northern boundary of the site (SV11, SV12 and SV13). Positive detections of PCE were reported within the soil vapour at location SV11, albeit substantially below the site assessment criteria, indicating that contaminated vapour has migrated over the northern boundary in shallow soils and is present within soil vapour, but does not represent a risk to offsite receptors on the ground surface and/or construction workers who may require to access shallow services.

Deep soil vapour probes installed beyond the northern site boundary (**Figure 4C**), SV18 and SV19 were reported to contain highly elevated concentrations of PCE and TCE. Given the proximity of these sample locations to the basement of 121 Henry Street, a potential vapour intrusion pathway was identified which has been further assessed in JBS&G (2019).

The soil-vapour impact at depth indicates the presence of a deep source of chlorinated ethenes at/or adjacent to the site. The low concentrations reported in groundwater indicate that significant source is not present in the saturated zone.

12.6 Site Management Strategy

Based on the proposed land use, the scope of work completed for this assessment and the limitations presented in **Section 11**, there are considered to be no unacceptable risks to current site users under an ongoing commercial/industrial land use scenario. With respect to the risks posed to future site users under the proposed Penrith City Park land uses, elevated concentrations of VOCs in soil-vapour represent a potentially unacceptable risk. In addition, offsite migration of VOCs is currently occurring over the northern site boundary. A site management strategy will be required to address these issues. The following management actions should be undertaken:

- An interim environmental monitoring plan (EMP) should be prepared for the site. The EMP should specify requirements for ongoing monitoring of indoor air in Shop 3/140 Henry Street and specify action-response protocols in the event that elevated concentrations of CEs are identified. Additionally, the EMP should guide any site maintenance activities which involve disturbance of soils underlying hardstand pavements or building footprints across the site. The interim EMP should make specific reference to, and specify worker controls for, impacted soils/soil-vapour underlying 134-138 and 140 Henry Street as well as potential asbestos containing material in shallow soils across the site. The plan should further control potential beneficial uses of groundwater in the period preceding site remediation;
- A Remedial Action Plan (RAP) is be required to be prepared to identify the preferred remedial methodology. The RAP should identify outstanding data gaps pertaining to soils underlying existing building footprints, potential deep soil-vapour impact sources and

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

underlying the four onsite transformers at the site. The RAP is required to be enacted prior to any site redevelopment activities and should specify controls to reduce the potential for contaminant migration as a result of demolition of hardstand pavements/site structures.

Additionally, site management controls including protocols to manage unexpected finds should be included in the interim EMP and the RAP and implemented during any ground disturbance works associated with site maintenance or development.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

13. Conclusions and Recommendations

In accordance with the limitations in **Section 14**, the following conclusions are provided:

- Whilst not positively identified as part of this DGI, the potential remains for USTs to be present within the former service station at 118 Henry Street;
- Historical service station operations at 118 Henry Street have not resulted in gross/widespread contamination of site media. Localised, minor contamination hotspots may exist underlying the existing building footprint;
- Historical chlorinated solvent contamination at 134-138 Henry Street has resulted in contamination of site soils, groundwater and soil-vapour at the site;
- Cessation of dry-cleaning operations has resulted in removal of the primary VOC contamination source. Soils nearby to and underlying sewerage infrastructure servicing 134-138 and 140 Henry Street are considered likely to represent an ongoing secondary source of contamination to groundwater and soil-vapour;
- VOC impacted media at the site is localised to the vicinity of the former dry-cleaner. Impacted soil vapour and groundwater are migrating over the northern boundary of the site. The extent of impacted groundwater plume migrating northwest of JBMW05 has not been delineated;
- Results of indoor ambient air sampling undertaken at Shop 3/140 Henry Street have been variable, exceeding the adopted site investigation criterion in one round. On this basis, additional indoor air monitoring is required to determine whether contamination of onsite media represents a risk to current site users;
- An assessment of vapour intrusion potential undertaken within the basement at 121 Henry Street, Penrith has determined that, whilst highly elevated soil-vapour concentrations exist on the boundary of the Council property (Henry Road), no significant vapour intrusion into the basement is occurring;
- With consideration of the proposed general development scenario, potential risks to future site users. On this basis, the site will require remediation prior to, or concurrent with, site redevelopment activities; and
- Based on the results of the completed investigations completed it is considered that the site is able to be made suitable for the proposed future land uses subject to implementation of a RAP.

The following recommendations are provided:

- Further groundwater and deep soil vapour assessment works are required the northwest of JBMW05 to provide a boundary to the plume extent.
- An interim EMP should be prepared for the site and should include ongoing monitoring of indoor air at Shop 3/140 Henry Street. In addition, the EMP should guide maintenance/construction activities which have the potential to involve disturbance of soils underlying current hardstands or building footprints and to control potential beneficial use of groundwater; and
- To address potential risks to future site users and potential risks to offsite receptors beyond the northern boundary, an RAP is required to be produced. The RAP should address existing data gaps pertaining to soils underlying existing buildings, offsite soil vapour impacts and the preferred remedial strategy for the site.

14. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquires.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the Site history. Further chemicals or categories of chemicals may exist at the Site, which were not identified in the Site history and which may not be expected at the Site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the Site, and it is limited to the scope defined herein. Should information become available regarding conditions at the Site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

List of NSW Contaminated Sites Notified to EPA as of 22 December 2017

Background

A strategy to systematically assess, prioritise and respond to notifications under Section 60 of the *Contaminated Land Management Act 1997* (CLM Act) has been developed by the EPA. This strategy acknowledges the EPA's obligations to make information available to the public under *Government Information (Public Access) Act 2009*.

When a site is notified to the EPA, it may be accompanied by detailed site reports where the owner has been proactive in addressing the contamination and its source. However, often there is minimal information on the nature or extent of the contamination.

For some notifications, the information indicates the contamination is securely immobilised within the site, such as under a building or carpark, and is not currently causing any offsite consequences to the community or environment. Such sites would still need to be cleaned up, but this could be done in conjunction with any subsequent building or redevelopment of the land. These sites may not require intervention under the CLM Act, but could be dealt with through the planning and development consent process.

Where indications are that the nominated site is causing actual harm to the environment or an unacceptable offsite impact (i.e. it is a "significantly contaminated site"), the EPA would apply the regulatory provisions of the CLM Act to have the responsible polluter and/or landowner investigate and remediate the site.

As such, the sites notified to the EPA and presented in the following table are at various stages of the assessment and/or remediation process. Understanding the nature of the underlying contamination, its implications and implementing a remediation program where required, can take a considerable period of time. The tables provide an indication, in relation to each nominated site, as to the management status of that particular site. Further detailed information may be available from the EPA or the responsible landowner.

The following questions and answers may assist those interested in this issue:

Frequently asked questions

What is the difference between the "List of NSW Contaminated Sites Notified to the EPA" and the "Contaminated Land: Record of Notices"?

A site will be on the Contaminated Land: Record of Notices only if the EPA has issued a regulatory notice in relation to the site under the *Contaminated Land Management Act 1997*.

The sites appearing on this "List of NSW contaminated sites notified to the EPA" indicate that the notifiers consider that the sites are contaminated and warrant reporting to the EPA. However, the contamination may or may not be significant enough to warrant regulation by the EPA. The EPA needs to review and, if necessary, obtain more information before it can make a determination as to whether the site warrants regulation.

Why my site appears on the list?

Your site appears on the list because of one or more of the following reasons:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- The site owner and/or the person partly or fully responsible for causing the contamination notified to the EPA about the contamination under Section 60 of the *Contaminated Land Management Act 1997*. In other words, the site owner or the "polluter" believes the site is contaminated.
- The EPA has been notified via other means and is satisfied that the site is or was contaminated.

Does the list contain all contaminated sites in NSW?

No. The list only contains contaminated sites that the EPA is aware of, with regard to its regulatory role under the CLM Act. An absence of a site from the list does not necessarily imply the site is not contaminated.

The EPA relies upon responsible parties to notify contaminated sites.

How are these notified contaminated sites managed by the EPA?

There are different ways that the EPA manages these notified contaminated sites. First, an initial assessment is carried out by the EPA. At the completion of the initial assessment, the EPA may take one or more than one of the following management approaches:

- The contamination warrants the EPA's direct regulatory intervention either under the *Contaminated Land Management Act 1997* or the *Protection of the Environment Operations Act 1997* (POEO Act), or both. Information about current or past regulatory action on this site can be found on EPA website.
- The contamination with respect to the current use or approved use of the site, as defined under the *Contaminated Land Management Act 1997,* is not significant enough that it warrants EPA regulation.
- The contamination does not require EPA regulation and can be managed by a planning approval process.
- The contamination is related to an operational Underground Petroleum Storage System, such as a service station or fuel depot. The contamination may be managed under the POEO Act and the Protection of the Environment Operation (Underground Petroleum Storage Systems) Regulation 2008.
- The contamination is being managed under a specifically tailored program operated by another agency (for example the Department of Industry and Investment's *Derelict Mines Program*).

I am the owner of a site that appears on the list. What should I do?

First of all, you should ensure the current use of the site is compatible with the site contamination. Secondly, if the site is the subject of EPA regulation, make sure you comply with the regulatory requirements, and you have considered your obligations to notify other parties who may be affected.

If you have any concerns, contact us and we may be able to offer you general advice, or direct you to accredited professionals who can assist with specific issues.

I am a prospective buyer of a site that appears on the list. What should I do?

You should seek advice from the vendor to put the contamination issue into perspective. You may need to seek independent expert advice.

The information provided in the list is meant to be indicative only, and a starting point for your own assessment. Site contamination as a legacy of past site uses is not uncommon,

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

particularly in an urbanised environment. If the contamination on a site is properly remediated or managed, it may not materially impact upon the intended future use of the site. However, each site needs to be considered in context.

List of NSW Contaminated Sites Notified to the EPA

Disclaimer

The EPA has taken all reasonable care to ensure that the information in the list of contaminated sites notified to the EPA (the list) is complete and correct. The EPA does not, however, warrant or represent that the list is free from errors or omissions or that it is exhaustive.

The EPA may, without notice, change any or all of the information in the list at any time.

You should obtain independent advice before you make any decision based on the information in the list.

The list is made available on the understanding that the EPA, its servants and agents, to the extent permitted by law, accept no responsibility for any damage, cost, loss or expense incurred by you as a result of:

1. any information in the list; or
2. any error, omission or misrepresentation in the list; or
3. any malfunction or failure to function of the list;
4. without limiting (2) or (3) above, any delay, failure or error in recording, displaying or updating information.

Site Status	Explanation
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or *Protection of the Environment Operations Act 1997*. Alternatively, the EPA may require information via a notice issued under s77 of the *Contaminated Land Management Act 1997* or issue a Preliminary Investigation Order.
Regulation under CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the *Contaminated Land Management Act 1997* is not required.
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997*. A regulatory approach is being finalised.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the *Protection of the Environment Operations Act 1997* (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the *Environmental Planning and Assessment Act 1979* (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the *Protection of the Environment Operations Act 1997* (POEO Act).
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the *Environmental Planning and Assessment Act 1979* (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the *Contaminated Land Management Act 1997* (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record.

Search for NSW heritage

Return to search page where you can refine/broaden your search.

Statutory listed items

Information and items listed in the State Heritage Inventory come from a number of sources. This means that there may be several entries for the same heritage item in the database. For clarity, the search results have been divided into three sections.

- **Section 1** - contains Aboriginal Places declared by the **Minister for the Environment** under the National Parks and Wildlife Act. This information is provided by the Heritage Division.
- **Section 2** - contains heritage items listed by the **Heritage Council of NSW** under the NSW Heritage Act. This includes listing on the State Heritage Register, an Interim Heritage Order or protected under section 136 of the NSW Heritage Act. This information is provided by the Heritage Division.
- **Section 3** - contains items listed by **local councils** on Local Environmental Plans under the Environmental Planning and Assessment Act, 1979 and **State government agencies** under s.170 of the Heritage Act. This information is provided by local councils and State government agencies.

Section 1. Aboriginal Places listed under the National Parks and Wildlife Act.

Your search did not return any matching results.

Section 2. Items listed under the NSW Heritage Act.

Your search returned 14 records.

SEWER AVAILABLE

Where the sewer is not available and a special inspection is involved the board accepts no responsibility for the suitability of the drainage in relation to the eventual position of the Board's sewer. The existence and position of the Board's sewers, stormwater channels, pipes, mains and structures should be ascertained by inspection of records available at Board's Business Offices. (Section 33 of Board's Act). Position of structures, boundaries, sewers and sewerage service shown hereon are approximate only and in general the outlines of buildings may have been drawn from initial building plans submitted to the Board. Discrepancies in outline can occur from amendment to these plans. Discrepancies in position and type of drainage lines and fittings can be due to unnotified work. Before building work is commenced location of drainage lines is recommended. Licensee is required to submit to the Board a Certificate of Compliance as not all work may have been supervised.

NOTE: This diagram only indicates availability of a sewer and any sewerage service shown as existing in Board's records (By-law 8, Clause 3).

Note: Position of House Service Drainage shown by broken lines is assumed.

For Regional Manager

NOTE This diagram only indicates availability of a sewer and any sewerage service shown as existing in Sydney Water's records. The existence and position of Sydney Water's sewers, stormwater channels, pipes, mains and structures should be ascertained by inspection of maps available at any of Sydney Water's Customer Centres. Position of structures, boundaries, sewers and sewerage services shown hereon are approximately only.

NOTES

- TREE SIZES ARE ESTIMATES ONLY
- ONLY VISIBLE SERVICES HAVE BEEN LOCATED IN THIS SURVEY.
- USERS OF THIS DRAWING HAVE A DUTY OF CARE TO CONTACT "DIAL BEFORE YOU DIG" FREE CALL 1100 OR FOR SPEED OF RESPONSE VISIT www.dialbeforeyoudig.com.au
- SERVICE & UTILITIES SHOWN ON PLAN HAVE BEEN LOCATED BY PHYSICAL EVIDENCE ON SITE &/OR BY REFERENCE TO SERVICE PLANS FROM STATUTORY AUTHORITIES. SOME PITS MAY NOT HAVE BEEN OPENED TO VERIFY THE TYPE OF UTILITY. NEITHER EXCAVATION NOR POTHOLING HAVE BEEN CARRIED OUT TO CONFIRM UNDERGROUND LOCATION. SERVICE DETAILS SHOULD BE CONFIRMED WITH THE RELEVANT SERVICE AUTHORITY DURING DESIGN & PRIOR TO ANY CONSTRUCTION.
- TELSTRA ADVISES THAT THIS SITE IS WITHIN THE PROXIMITY OF SOME OF THEIR MAJOR NETWORK. AS PART OF YOUR DUTY OF CARE PLEASE CONTACT THE NETWORKING INTEGRITY AND COMPLIANCE GROUP (1800 653935) PRIOR TO PROCEEDING WITH ANY WORK.
- AS PART OF YOUR DUTY OF CARE PLEASE CONTACT THE FOLLOWING:

JEMENA GAS	Ph. 132909
ENERGY AUSTRALIA	Ph. 131525
INTEGRAL ENERGY	Ph. 131002
SYDNEY WATER	Ph. 132092
OPTUS-VISION	Ph. 1800 505777

- ALL DIMENSIONS MUST BE VERIFIED ON SITE PRIOR TO ANY CONSTRUCTION.
- THIS PLAN HAS BEEN PREPARED FOR THE EXCLUSIVE USE OF GHD SYDNEY
- THE POSITION OF SURVEYED DATA HAS BEEN LOCATED AND IS SHOWN TO TOPOGRAPHIC ACCURACIES. IF CLEARANCES TO BOUNDARIES OR OTHER FEATURES ARE CRITICAL AND DIMENSIONS ARE NOT SHOWN FURTHER SURVEY MAY BE REQUIRED.
- ANY CONSTRUCTION ON OR NEAR BOUNDARIES WILL REQUIRE FURTHER SURVEY IN ORDER THAT MARKS DEFINING BOUNDARIES CAN BE PLACED.
- BEARING AND DISTANCES OF BOUNDARIES ARE BY TITLE ONLY WITH BEARINGS RELATED TO M.G.A.
- IF ACCURATE TRUE NORTH IS REQUIRED A FURTHER SURVEY WOULD BE NECESSARY.

Engineering Log - Non Cored Borehole

Project No.: PSM3158

Client:	JBS&G	Commenced:	07/05/2017
Project Name:	Central Park Village, Penrith	Completed:	07/05/2017
Hole Location:	114 to 146 Henry St & Allen Pl Carpark, Penrith	Logged By:	AK
Hole Position:	286646.0 m E 6262847.0 m N	Checked By:	AS

Drill Model and Mounting:	Commachio 405	Inclination:	-90°	RL Surface:	No survey
Hole Diameter:	125 mm	Bearing:		Datum:	AHD Operator: Terratest

Drilling Information								Soil Description				Observations
Method	Penetration	Support	Water	Samples Tests Remarks	Recovery	RL (m)	Depth (m)	Graphic Log	Classification Symbol	Material Description SOIL NAME: Colour, structure, plasticity, additional	Moisture Condition	Consistency / Relative Density	Hand Penetrometer UCS (kPa) 100 200 300 400 500	Structure and Additional Observations
AD/T							6			CLAY with a trace of sand; brown and dark orange, medium to high plasticity, fine to medium grained. *(continued)*	M	St		
							7							
							8			Clayey sandy GRAVEL; brown, sub-rounded to rounded up to 100mm, medium plasticity, fine to medium grained.	W	VD		8.10: High resistance, rate of penetration significantly reduced Inferred GRAVEL unit
							9							

Method
AD/T - Auger drilling TC bit
AD/V - Auger drilling V bit
WB - Washbore
SPT - Standard penetration test
PT - Push tube
AS - Auger Screwing

Penetration
No resistance through to refusal

Water
Inflow
Partial Loss
Complete Loss

Samples and Tests
U - Undisturbed Sample
D - Disturbed Sample
SPT - Standard Penetration Test
ES - Environmental Sample
TW - Thin Walled
LB - Large Disturbed Sample

Classification symbols and soil descriptions based on Unified Soil Classification System

Moisture Condition
D - Dry
M - Moist
W - Wet

Consistency/Relative Density
VS - Very soft
S - Soft

EXPLANATION SHEET - SOIL DESCRIPTION

DEFINITIONS

Soil:
In engineering terms, soil includes every type of uncemented or partially cemented inorganic or organic material found in the ground. In practice, if the material can be remoulded or disintegrated by hand in its field condition or in water it is described as a soil. Other materials are described using rock description terms.

Classification symbol & soil name:
Soils are described in accordance with the Unified Soil Classification (UCS) as shown in the table on Sheet 2.

Support:
C - Casing
T - Timbering

See rock description on Sheet 3 for method and samples / field test definitions.

PARTICLE SIZE DESCRIPTIVE TERMS

NAME	SUBDIVISION	SIZE
Boulders		>200 mm
Cobbles		63 mm to 200 mm
Gravel	coarse	20 mm to 63 mm
	medium	6 mm to 20 mm
	fine	2.36 mm to 6 mm
Sand	coarse	600 µm to 2.36 mm
	medium	200 µm to 600 µm
	fine	75 µm to 200 µm

MOISTURE CONDITION

CONDITION	FIELD GUIDE
Dry	Looks and feels dry. Cohesive and cemented soils are hard, friable or powdery. Uncemented granular soils run freely through hands.
Moist	Soil feels cool and darkened in colour. Cohesive soils can be moulded. Granular soils tend to cohere
Wet	As for moist but with free water forming on hands when handles

CONSISTENCY OF COHESIVE SOILS

TERM	UNDRAINED STRENGTH SU (kPa)	FIELD GUIDE
Very Soft	<12	A finger can be pushed well into the soil with little effort
Soft	12 – 25	A finger can be pushed into the soil to about 25mm depth
Firm	25 – 50	The soil can be indented about 5mm with the thumb, but not penetrated
Stiff	50 – 100	The surface of the soil can be indented with the thumb, but not penetrated
Very Stiff	100 – 200	The surface of the soil can be marked, but not indented with thumb pressure
Hard	>200	The surface of the soil can be marked only with the thumbnail

DENSITY OF GRANULAR SOILS

TERM	DENSITY INDEX (%)
Very loose	<15
Loose	15 – 35
Medium Dense	35 – 65
Dense	65 – 85
Very Dense	>85

Where no SPT data, the following descriptions are used:

Loose: Can be removed from exposure by hand in a disaggregated form.

Compact (C) Only removed from exposure with an implement, material readily disaggregated by physical means.

Cemented (Ce) Only removed from exposure with an implement, material cannot be disintegrated / remoulded in air/ water.

MINOR COMPONENTS

TERM	ASSESSMENT GUIDE	PROPORTION OF MINOR COMPONENT
Trace of	Presence just detectable by feel or eye, but soil properties little or no different to general properties of primary component.	Coarse grained soils: <5% Fine grained soils: <15%
With some	Presence easily detected by feel or eye, soil properties little different to general properties of primary component.	Coarse grained soils: 5 - 12% Fine grained soils: 15 - 30%

SOIL STRUCTURE

ZONING		CEMENTING	
Layers	Continuous across exposure of sample	**Weakly Cemented**	Easily broken up by hand in air or water
Lenses	Discontinuous layers of lenticular shape	**Moderately Cemented**	Effort is required to break up the soil by hand in air or water
Pockets	Irregular inclusions of different material	**Cemented**	Only removed from exposure by implement, material does not disaggregate
		Compact	Only removed from exposure by implement, material readily disaggregated by physical means

GEOLOGICAL ORIGIN

Weathered in place soils:

Extremely weathered — Structure and fabric of parent rock visible

Residual Soil — Structure and fabric of parent rock not visible

Transported soil:

Aeolian — Deposited by wind

Alluvium — Deposited by streams and rivers

Colluvium — Deposited on slopes (transported downslope by gravity)

Lacustrine — Deposited by lakes

Marine — Deposited in ocean basins, bays, beached and estuaries

Man Made:

Fill — Fill may be significantly more variable between tested locations than naturally occurring soils

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

EXPLANATION SHEET - SOIL DESCRIPTION

SOIL CLASSIFICATION INCLUDING IDENTIFICATION AND DESCRIPTION

FIELD IDENTIFICATION PROCEDURES (EXCLUDING PARTICLES LARGER THAN 60 mm AND BASING FRACTIONS ON ESTIMATED MASS)*							USC	PRIMARY NAME
COARSE GRAINED SOILS More than 50% of materials less than 63 mm is larger than 0.075 mm	(A 0.475 mm particle is about the smallest particle visible to the naked eye)	GRAVELS More than half of coarse fraction is larger than 2.0 mm	CLEAN GRAVELS (Little or no fines)	Wide range in grain size and substantial amounts of all intermediate particle sizes.			GW	GRAVEL
				Predominantly one size or a range of sizes with more intermediate sizes missing.			GP	GRAVEL
			GRAVELS WITH FINES (Appreciable amount of fines)	Non-plastic fines (for identification procedures see ML below)			GM	SILTY GRAVEL
				Plastic fines (for identification procedures see CL below)			GC	CLAYEY GRAVEL
		SANDS More than half of coarse fraction is smaller than 2.0 mm	CLEAN SANDS (Little or no fines)	Wide range in grain sizes and substantial amounts of all intermediate sizes missing			SW	SAND
				Predominantly one size or a range of sizes with some intermediate sizes missing.			SP	SAND
			SANDS WITH FINES (Appreciable amount of fines)	Non-plastic fines (for identification procedures see ML below).			SM	SILTY SAND
				Plastic fines (for identification procedures see CL below).			SC	CLAYEY SAND
FINE GRAINED SOILS More than 50% of material less than 63 mm is smaller than 0.075 mm			IDENTIFICATION PROCEDURES ON FRACTIONS <0.2 mm.					
		SILTS & CLAYS Liquid limit less than 50	**Dry strength**	**Dilatancy**	**Toughness**			
			None to Low	Quick to slow	None		ML	SILT
			Medium to High	None	Medium		CL	CLAY
			Low to medium	Slow to very slow	Low		OL	ORGANIC SILT
		SILTS & CLAYS Liquid limit greater than 50	Low to medium	Slow to very slow	Low to medium		MH	SILT
			High	None	High		CH	CLAY
			Medium to High	None	Low to medium		OH	ORGANIC CLAY
HIGHLY ORGANIC SOIL Readily identified by colour, odour, spongy feel and frequently by fibrous texture							Pt	PEAT

• Low plasticity – Liquid Limit W_L less than 35%. • Medium plasticity – W_L between 35% and 50%.

*Taken from AS1726 (1993)

COMMON DEFECTS IN SOIL

TERM	DEFINITION
Parting	A surface or crack across which the soil has little or no tensile strength. Parallel or sub parallel to layering (e.g. bedding). May be open or closed.
Joint	A surface or crack across which the soil has little or no tensile strength but which is not parallel or sub parallel to layering. May be open or closed. The term 'fissure' may be used for irregular joints <0.2 m in length.
Sheared Zone	Zone in clayey soil with roughly parallel near planar, curved or undulating boundaries containing closely spaced, smooth or slickensided, curved intersecting joints which divide the mass into lenticular or wedge shaped blocks.
Sheared Surface	A near planar curved or undulating, smooth, polished or slickensided surface in clayey soil. The polished or slickensided surface indicates that movement (in many cases very little) has occurred along the defect.
Softened Zone	A zone in clayey soil, usually adjacent to a defect in which the soil has a higher moisture content than elsewhere.
Tube	Tubular cavity. May occur singly or as one of a large number of separate or inter-connected tubes. Walls often coated with clay or strengthened by denser packing of grains. May contain organic matter
Tube Cast	Roughly cylindrical elongated body of soil different from the soil mass in which it occurs. In some cases, the soil that makes up the tube cast is cemented.
Infilled Seam	Sheet or wall like body of soil substance or mass with roughly planar to irregular near parallel boundaries that cuts through a soil mass. Formed by infilling of open joints.

EXPLANATION SHEET - ROCK DESCRIPTION

DEFINITIONS

Rock Substance:
In engineering terms rock substance is any naturally occurring aggregate of minerals and organic material which cannot be disintegrated or remoulded by hand in air or water. Other material is described using soil descriptive terms. Effectively homogenous material may be isotropic or anisotropic.

Defect:
Discontinuity or break in the continuity of a substance or substances.

Mass:
A body of material that is not effectively homogeneous. It can consist of two or more substances without defects, or one or more substances with one or more defects.

Method:

AD/T	Auger drilling with tcbit
AD/V	Auger drilling with vbit
AS	Auger screwing
AT	Air track
B	Dozer blade
BH	Backhoe bucket
CT	Cable tool
DB	Washbore drag bit
DT	Diatube
E	Excavator
EH	Excavator with hammer
HA	Hang auger
HMLC	HMLC core barrel
HQ3	Coring 63.5mm diameter, triple tube, wireline
MZ	Mazier
N	Natural exposure
NMLC	NMLC core barrel
NQ3	Coring 45.1mm diameter, triple tube, wireline
PQ3	Coring 83.1mm diameter, triple tube, wireline
Pushed SPT	Pushed SPT
PT	Push tube
R	Ripper
RR	Rock roller
SPT	Driven SPT
WB	Washbore
X	Existing excavation

Core Quality:

TCR	Total Core Recovered (%)
RQD	Rock Quality Designation (%)

Samples and Field Tests:

B	Bulk Disturbed Sample
BLK	Block sample
C	Core sample
CBR	CBR mould sample
D	Small disturbed sample
ES	Soil sample for environmental testing
EW	Water sample for environmental testing
G	Gas sample
LB	Large bulk disturbed sample
M	Mazier type sample
P	Piston sample
SPT	Standard Penetration Test
U	Undisturbed push in sample
W	Water sample

Rock Strength:

A	Axial point load test result (Is50)
D	Diametral point load test result (Is50)

Water:

▻ Inflow
◅ Partial Loss
◄ Complete Loss

SUBSTANCE DESCRIPTIVE TERMS

Rock name:
Simple rock names are used rather than precise geological classification

Particle size (for sandstone):
Coarse - Mainly 0.6mm to 2mm
Medium - Mainly 0.2mm to 0.6mm
Fine - Mainly 0.05mm (just visible) to 0.2mm

Fabric:
Massive - No layering or penetrative fabric
Indistinct - Layering or fabric visible. Little effect on properties
Distinct - Layering or fabric is easily visible. Rock breaks more easily parallel to layering of fabric

Bedding:
Thinly Laminated - <6mm
Laminated - 6 – 20mm
Very Thinly Bedded - 20 – 60mm
Thinly Bedded - 60 – 200mm
Medium Bedded - 200 – 600mm
Thickly Bedded - 600 – 2000mm
Very Thickly Bedded - >2000mm

ROCK SUBSTANCE STRENGTH

ABBR	TERM	POINT LOAD INDEX, IS50 (MPA)	FIELD GUIDE
EL	Extremely Low	≤0.03	Easily remoulded by hand to a material with soil properties
VL	Very Low	>0.03≤0.1	Material crumbles under firm blows with sharp end of pick; can be peeled with a knife; pieces up to 30mm thick can be broken by finger pressure.
L	Low	>0.1≤0.3	Easily scored with a knife; indentations 1mm to 3mm show with firm bows of a pick point; has a dull sound under hammer. Pieces of core 150mm long by 50mm diameter may be broken by hand. Sharp edges of core may be friable and break during handling.
M	Medium	>0.3≤1.0	Readily scored with a knife; a piece of core 150mm long by 50mm diameter can be broken by hand with difficulty.
H	High	>1≤3	A piece of core 150mm long by 50mm cannot be broken by hand but can be broken by a pick with a single firm blow; rock rings under hammer.
VH	Very High	>3≤10	Hand specimen breaks after more than one blow of a pick; rock rings under hammer.
EH	Extremely High	>10	Specimen requires many blows with geological pick to break; rock rings under hammer.

Version: 1, Version Date: 14/04/2021

EXPLANATION SHEET - ROCK DESCRIPTION

CLASSIFICATION OF WEATHERING

ABBR	TERM	FIELD GUIDE
F	Fresh	Rock substance unaffected by weathering
SW	Slightly Weathered	Rock substance affected by weathering to the extent that partial staining or partial discolouration of the rock substance (usually by limonite) has taken place. The colour and texture of the fresh rock is recognisable; strength properties are essentially those of the fresh rock substance
MW	Moderately Weathered	The whole of the rock substance is discoloured, usually by iron staining or bleaching, to the extent that the colour of the fresh rock is no longer recognisable.
HW	Highly Weathered	Rock strength is changed by weathering. The whole of the rock substance is discoloured, usually by iron staining or bleaching to the extent that the colour of the original rock is not recognisable. Some minerals are decomposed to clay minerals. Porosity may be increased by leaching or may be decreased due to the deposition of minerals in pores.
EW	Extremely Weathered	Material is weathered to such an extent that it has soil properties, i.e.; it either disintegrates or can be remoulded in water. Original rock fabric still visible.

COMMON DEFECTS IN ROCK MASS

ABBR	TERM	FIELD GUIDE
FT	Fault	Fracture long which displacement is recognisable
SS	Shear Seam	A fracture along which movement has taken place but no displacement is recognisable. Evidence for movement may be slickensides, polishing and/or clay gouge
SZ	Sheared Zone	Zone of multiple closely spaced fracture planes with roughly parallel planar boundaries usually forming blocks of lenticular or wedge shaped intact material. Fractures are typically smooth, polished or slickensided; and curved
BP	Bedding Parting	Arrangement in layers of mineral grains or crystals parallel to surface of deposition along which a continuous observable parting occurs
SM	Seam	Seam of soil substance, often with gradational boundaries. Formed by weathering of the rock substance in place
IS	Infilled Seam	Seam of soil substance usually with distinct roughly parallel boundaries formed by the migration of soil into an open cavity or joint, infilled seams less than 1mm thick may be described as veneer or coating on joint surface
JT	Joint	A single fracture across which rock has little or no tensile strength and is not obviously related to rock fabric
CO	Contact	Surface between two lithologies
CZ	Crushed Zone	Zone with roughly parallel, planar boundaries (commonly slickensided) containing disoriented usually angular rock fragments of variable size often in a soil matrix.
VN	Vein	Fracture in which a tabular or sheet-like body of minerals have been intruded
FZ	Fractured Zone	A zone of closely spaced defects (mainly joints, bedding, cleavage and/or schistosity) comprised of core lengths in the order of 50mm or less.
BSH	Bedding Shear	A shear formed along a bedding plane
DB	Drilling Break	Drilling induced break

SHAPE TERMS

ABBR	TERM	FIELD GUIDE
PR	Planar	The defect does not vary in orientation
CU	Curved	The defect has a gradual change in orientation
UN	Undulating	The defect has a wavy surface
ST	Stepped	The defect has one or more well defined steps
IR	Irregular	The defect has many sharp changes of orientation

ROUGHNESS TERMS

ABBR	TERM	FIELD GUIDE
SL	Slickensided	Grooved or striated surface, usually polished
POL	Polished	Shiny smooth surface
S	Smooth	Smooth to touch. Few or no surface irregularities
RF	Rough	Many small surface irregularities (amplitude generally less than 1mm). Feels like fine to coarse sand paper.
VR	Very Rough	Many large surface irregularities (amplitude generally more than 1mm). Feels like, or coarser than very coarse sand paper.

COATING TERMS

ABBR	TERM	FIELD GUIDE
CN	Clean	No visible coating
SN	Stained	No visible coating but surfaces are discoloured
VN	Veneer	A visible coating of soil or mineral, too thin to measure; may be patchy
CO	Coating	A visible coating up to 1mm thick. Thicker soil material is usually described using appropriate defect terms (e.g., infilled seam). Thicker rock strength material is usually described as a vein

INFILLING MATERIAL

ABBR	TERM
CA	Calcite
CL	Clay
Fe	Iron Oxide
Fe Clay	Iron Oxide Clay
KT	Chlorite
MS	Secondary Mineral
MU	Unidentified Mineral
Qz	Quartz
X	Carbonaceous
RF	Rock fragments
G	Gravel
S	Sand
Z	Silt

Notes:

The instrument identified by the serial number stated above has been tested by Gas Data personnel for calibration accuracy on the date and under the ambient conditions stated. Gas Data Ltd internal BS EN ISO9001:2015 compliant workshop procedures were followed to apply known calibration test gases, gas flow rates, pressures and temperatures of the values stated. The results displayed on the instrument at each stage are recorded above.

Gas Data Ltd is certified to BS EN ISO9001:2015. Certificate NQA 8374. Valid until 22/03/2019

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 52372
COC number: Not provided
Turn around time: 5 Day
Date/Time received: Apr 12, 2018 10:17 AM
Eurofins | mgt reference: **593556**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 8.3 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

pH (USA HCl addition)	0.1	pH Units	1.6

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Polycyclic Aromatic Hydrocarbons	Melbourne	Apr 16, 2018	7 Day
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Melbourne	Apr 13, 2018	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

This report has been revised (V3) to include test results for sample M18-Ap29342 and to remove the results from sample M18-Ap12239.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
C01	Leachate Fluid Key: 1 - pH 5.0; 2 - pH 2.9; 3 - pH 9.2; 4 - Reagent (DI) water; 5 - Client sample, 6 - other
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Apr 26, 2018	14 Day
- Method: LTM-ORG-2010 TRH C6-C36			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 26, 2018	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

This report has been revised (V3) to include test results for sample M18-Ap29342 and to remove the results from sample M18-Ap12239.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Apr 16, 2018	7 Day
- Method: LTM-ORG-2010 TRH C6-C36			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 13, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 16, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
BTEX	Melbourne	Apr 13, 2018	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Volatile Organics	Melbourne	Apr 13, 2018	7 Days
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Polycyclic Aromatic Hydrocarbons	Melbourne	Apr 16, 2018	7 Day
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Melbourne	Apr 13, 2018	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

This report has been revised (V3) to include test results for sample M18-Ap29342 and to remove the results from sample M18-Ap12239.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

EXTERNAL EMAIL*

Hi Nibha,

HOLD

Thank you for that.

One last round to schedule here:

- JBMW03 2.0-2.1: PAHs and lead Ap12261 5.9 ds 10/4
- JBMW04 1.0-1.2: TRHs and VOCs 12267 522

Standard turn around time – I unersand we are out of holding times for some analytes.

Rohan.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 52372
COC number: Not provided
Turn around time: 5 Day
Date/Time received: Apr 30, 2018 4:54 PM
Eurofins | mgt reference: **596225**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	May 03, 2018	14 Day
- Method: LTM-ORG-2010 TRH C6-C36			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	May 03, 2018	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	May 03, 2018	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Volatile Organics	Melbourne	May 03, 2018	7 Days
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Polycyclic Aromatic Hydrocarbons	Melbourne	May 03, 2018	14 Day
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Heavy Metals	Melbourne	May 03, 2018	180 Day
- Method: LTM-MET-3030 by ICP-OES (hydride ICP-OES for Mercury)			
% Moisture	Melbourne	May 01, 2018	14 Day
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Follow Up Flag: Follow up
Flag Status: Completed

Hi guys, I have a couple of edits to this analytical request:

- Confirming the analyses for PSM01 is as follows: TRH/BTEX and VOCs, as per the provided COC - currently the SRA indicates only vTRHs and VOCs have been scheduled;
- Regarding the carbon tubes, only analyse the samples SV11-SV17 and QC20180417 for VOCs. No TRHs analysis is required – I understand this change will set back the delivery date to Friday 27 April.

Kind Regards,
Rohan Hammond

Subject: Eurofins | mgt Sample Receipt Advice - Report 594882 : Site PENRITH (53272)

Dear Valued Client,

Please find attached a Sample Receipt Advice (SRA), a Summary Sheet and a scanned copy of your Chain-of-Custody (COC). It is important that you check this documentation to ensure that the details are correct such as the Client Job Number, Turn Around Time, any comments in the Notes section and sample numbers as well as the requested analysis. If there are any irregularities then please contact your Eurofins | mgt Analytical Services Manager as soon as possible to make certain that they get changed.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 53272
COC number: 010452
Turn around time: 5 Day
Date/Time received: Apr 18, 2018 12:15 PM
Eurofins | mgt reference: **594882**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 12.3 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Only Vials received for sample PSM01

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Subject: Re: Eurofins | mgt Sample Receipt Advice - Report 594882 : Site PENRITH (53272)

Follow Up Flag: Follow up
Flag Status: Completed

Hi guys, I have a couple of edits to this analytical request:

- Confirming the analyses for PSM01 is as follows: TRH/BTEX and VOCs, as per the provided COC - currently the SRA indicates only vTRHs and VOCs have been scheduled;
- Regarding the carbon tubes, only analyse the samples SV11-SV17 and QC20180417 for VOCs. No TRHs analysis is required – I understand this change will set back the delivery date to Friday 27 April.

Kind Regards,
Rohan Hammond

Subject: Eurofins | mgt Sample Receipt Advice - Report 594882 : Site PENRITH (53272)

Dear Valued Client,

Please find attached a Sample Receipt Advice (SRA), a Summary Sheet and a scanned copy of your Chain-of-Custody (COC). It is important that you check this documentation to ensure that the details are correct such as the Client Job Number, Turn Around Time, any comments in the Notes section and sample numbers as well as the requested analysis. If there are any irregularities then please contact your Eurofins | mgt Analytical Services Manager as soon as possible to make certain that they get changed.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 53272
COC number: 010452
Turn around time: 5 Day
Date/Time received: Apr 18, 2018 12:15 PM
Eurofins | mgt reference: **594882**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 12.3 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Only Vials received for sample PSM01

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Certificate of Analysis

JBS & G Australia (NSW) P/L
Level 1, 50 Margaret St
Sydney
NSW 2000

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025 – Testing
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Isopropanol	Melbourne	Apr 20, 2018	14 Days
VOCs in Ambient Air by GC/MS	Melbourne	Apr 20, 2018	14 Day
- Method: LTM-ORG-2030 VOCs in Ambient Air by GC/MS			
Total Recoverable Hydrocarbons	Melbourne	Apr 20, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
VOC AIR-TRH (Total Recoverable Hydrocarbons)			
TRH >C10-C16	Melbourne	Apr 20, 2018	7 Day
- Method: MGT 100A

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 20, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons	Melbourne	Apr 20, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Apr 20, 2018	7 Day
- Method: LTM-ORG-2010 TRH C6-C36			
BTEX	Melbourne	Apr 20, 2018	14 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 20, 2018	7 Day
- Method: TRH C6-C40 - LTM-ORG-2010			
Volatile Organics	Melbourne	Apr 20, 2018	7 Days
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Polycyclic Aromatic Hydrocarbons	Melbourne	Apr 20, 2018	7 Day
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Polycyclic Aromatic Hydrocarbons (low level)	Melbourne	Apr 20, 2018	7 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Melbourne	Apr 20, 2018	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q02	The duplicate %RPD is outside the recommended acceptance criteria. Further analysis indicates sample heterogeneity as the cause
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

DRAFT

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

Thanks Asim,

I understand that the Air results are to be delivered Monday morning.

Ap 23274

Can you please also schedule sample JBMW03 for low level PAHs and 8 metals?

Kind Regards,
Rohan Hammond

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 53272
COC number: Not provided
Turn around time: 3 Day
Date/Time received: Apr 27, 2018 4:30 PM
Eurofins | mgt reference: **595919**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Zinc	0.005	mg/L	0.050

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Polycyclic Aromatic Hydrocarbons (low level)	Melbourne	Apr 27, 2018	7 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Melbourne	Apr 27, 2018	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

EXTERNAL EMAIL*

Hi guys,

For the lab batch submitted to you on Monday, can you please schedule:

Total organic carbon fraction on MWSV 6.9-7.0 and MWSV 7.9-8.0.

Rohan.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 55073
COC number: Not provided
Turn around time: 5 Day
Date/Time received: Nov 7, 2018 5:39 PM
Eurofins | mgt reference: **626517**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 3.6 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Samples TS (x2 vials) received broken. Sample TB (1 vial) received broken.

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 55073
COC number: 016621
Turn around time: 5 Day
Date/Time received: Nov 15, 2018 6:15 PM
Eurofins | mgt reference: **627998**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 5.2 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Authorised By

Nibha Vaidya	Analytical Services Manager
Harry Bacalis	Senior Analyst-Volatile (VIC)
Joseph Edouard	Senior Analyst-Organic (VIC)

Glenn Jackson
General Manager

Final report - this Report replaces any previously issued Report

- Indicates Not Requested

* Indicates NATA accreditation does not cover the performance of this service

Measurement uncertainty of test data is available on request or please click here.

Eurofins | mgt shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company, resulting from the use of any information or interpretation given in this report. In no case shall Eurofins | mgt be liable for consequential damages including, but not limited to, lost profits, damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the items tested. Unless indicated otherwise, the tests were performed on the samples as received.

Certificate of Analysis

JBS & G Australia (NSW) P/L

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
BTEX	Melbourne	Nov 19, 2018	14 Day
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Dissolved Gases	Melbourne	Nov 19, 2018	7 Day
- Method: LTM-ORG-2070 by Headspace GC-FID			
Volatile Organics	Melbourne	Nov 19, 2018	7 Days
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Chloride	Melbourne	Nov 19, 2018	28 Day
- Method: LTM-INO-4090 Chloride by Discrete Analyser			
Ferrous Iron - Fe2+	Melbourne	Nov 23, 2018	7 Days
- Method: LTM-INO-4190 Ferrous Iron in Water by Discrete Analyser			
Nitrate (as N)	Melbourne	Nov 19, 2018	28 Day
- Method: APHA 4500-NO3 Nitrate Nitrogen by FIA			
pH (at 25°C)	Melbourne	Nov 20, 2018	0 Hours
- Method: LTM-GEN-7090 pH in water by ISE			
Sulphate (as SO4)	Melbourne	Nov 19, 2018	28 Day
- Method: LTM-INO-4110 Sulfate by Discrete Analyser			
Total Organic Carbon	Melbourne	Nov 19, 2018	28 Day
- Method: APHA 5310B Total Organic Carbon			
Alkalinity (speciated)	Melbourne	Nov 20, 2018	14 Day
- Method: APHA 2320 Alkalinity by Titration

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

Hi Nibha,

Just confirming the water samples received today for 55073 are on 24 hr tat.

I forgot to double check the COC.

Rohan

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 55073
COC number: Not provided
Turn around time: 1 Day
Date/Time received: Nov 21, 2018 5:48 PM
Eurofins | mgt reference: **628902**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 10.1 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
BTEX	Melbourne	Nov 22, 2018	14 Day
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Volatile Organics	Melbourne	Nov 22, 2018	7 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

CERTIFICATE OF ANALYSIS 205736

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	C Bennett, Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**55073, Penrith**
Number of Samples	1 Water, 1 Carbon Tube
Date samples received	15/11/2018
Date completed instructions received	15/11/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	22/11/2018
Date of Issue	22/11/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris Guo, Senior Chemist, Air
Jeremy Faircloth, Organics Supervisor
Nick Sarlamis, Inorganics Supervisor
Steven Luong, Senior Chemist

Authorised By

Jacinta Hurst, Laboratory Manager

Method ID	Methodology Summary
AT-006	Dissolved gases determined by GC-FID using method USEPA SOP RSK175
AT-008	Determination of volatile organic compounds in charcoal tubes/badges/sorbents using CS2 extraction, based on NIOSH methods. Desorption efficiencies are not applied to results in ug/tube. Note where µg/m^3 results are supplied for SKC badges, the factors used are for 575-001, if 575-001 data is unavailable for an analyte then use 575-002 then 575-003 (exposure time must be supplied).
Inorg-001	pH - Measured using pH meter and electrode in accordance with APHA latest edition, 4500-H+. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA latest edition, 2320-B.
Inorg-055	Nitrate - determined colourimetrically. Soils are analysed following a water extraction.
Inorg-076	Ferrous Iron is determined colourimetrically by discrete analyser.
Inorg-079	TOC determined using a TOC analyser using the combustion method. Dissolved requires filtering prior to determination. Analysis using APHA latest edition 5310B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA latest edition, 4110-B. Alternatively determined by colourimetry/turbidity using Discrete Analyer.
Org-013	Water samples are analysed directly by purge and trap GC-MS.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

SAMPLE RECEIPT ADVICE

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	C Bennett, Rohan Hammond

Sample Login Details

Your reference	55073, Penrith
Envirolab Reference	205736
Date Sample Received	15/11/2018
Date Instructions Received	15/11/2018
Date Results Expected to be Reported	22/11/2018

Sample Condition

Samples received in appropriate condition for analysis	YES
No. of Samples Provided	1 Water, 1 Carbon Tube
Turnaround Time Requested	Standard
Temperature on Receipt (°C)	1.2
Cooling Method	Ice
Sampling Date Provided	YES

Comments

Nil

CERTIFICATE OF ANALYSIS 205744

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**Penrith**
Number of Samples	4xAir
Date samples received	16/11/2018
Date completed instructions received	16/11/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	23/11/2018
Date of Issue	21/11/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris Guo, Senior Chemist, Air

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

CERTIFICATE OF ANALYSIS 189181

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**52372, PCC**
Number of Samples	2 Soil
Date samples received	11/04/2018
Date completed instructions received	11/04/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	18/04/2018
Date of Issue	17/04/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Dragana Tomas, Senior Chemist
Jeremy Faircloth, Organics Supervisor
Leon Ow, Chemist

Method ID	Methodology Summary
Inorg-008	Moisture content determined by heating at 105+/-5 °C for a minimum of 12 hours.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis. Note, the Total +ve TRH PQL is reflective of the lowest individual PQL and is therefore "Total +ve TRH" is simply a sum of the positive individual TRH fractions (>C10-C40).
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'EQ PQL'values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'EQ zero'values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'EQ half PQL'values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

CERTIFICATE OF ANALYSIS 189745

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**52372**
Number of Samples	2 Water
Date samples received	18/04/2018
Date completed instructions received	18/04/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	26/04/2018
Date of Issue	23/04/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Dragana Tomas, Senior Chemist
Jaimie Loa-Kum-Cheung, Senior Chemist
Jeremy Faircloth, Organics Supervisor
Steven Luong, Senior Chemist

Authorised By

Jacinta Hurst, Laboratory Manager

Method ID	Methodology Summary
Metals-021	Determination of Mercury by Cold Vapour AAS.
Metals-022	Determination of various metals by ICP-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

CERTIFICATE OF ANALYSIS 189180

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**Penrith**
Number of Samples	4xAir
Date samples received	11/04/2018
Date completed instructions received	11/04/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	18/04/2018

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Report Comments

PQL has been raised for IPA in sample #2 due to interference from analytes (other than those being tested) in the sample/s.

CERTIFICATE OF ANALYSIS 189771

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**Penrith**
Number of Samples	5xAir
Date samples received	18/04/2018
Date completed instructions received	18/04/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	26/04/2018
Date of Issue	23/04/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

CERTIFICATE OF ANALYSIS 191187

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**Penrith**
Number of Samples	1xAir
Date samples received	09/05/2018
Date completed instructions received	09/05/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	11/05/2018
Date of Issue	11/05/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris Guo, Senior Chemist, Air

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

EXTERNAL EMAIL*

Hi guys,

For the lab batch submitted to you on Monday, can you please schedule:

Total organic carbon fraction on MWSV 6.9-7.0 and MWSV 7.9-8.0.

Rohan.

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 55073
COC number: Not provided
Turn around time: 5 Day
Date/Time received: Nov 7, 2018 5:39 PM
Eurofins | mgt reference: **626517**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 3.6 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Samples TS (x2 vials) received broken. Sample TB (1 vial) received broken.

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

				Result 1	Result 2	RPD			
Total Organic Carbon	S18-No09077	CP	%	0.1	0.2	21	30%	Pass	
% Moisture	S18-No09099	NCP	%	15	15	2.0	30%	Pass	

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Rohan Hammond
Project name: PENRITH
Project ID: 55073
COC number: 016621
Turn around time: 5 Day
Date/Time received: Nov 15, 2018 6:15 PM
Eurofins | mgt reference: **627998**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 5.2 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Isopropanol	Melbourne	Nov 15, 2018	14 Days
- Method:			
VOCs in Ambient Air by GC/MS	Melbourne	Nov 15, 2018	14 Day
- Method: LTM-ORG-2030 VOCs in Ambient Air by GC/MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
BTEX	Melbourne	Nov 19, 2018	14 Day
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Dissolved Gases	Melbourne	Nov 19, 2018	7 Day
- Method: LTM-ORG-2070 by Headspace GC-FID			
Volatile Organics	Melbourne	Nov 19, 2018	7 Days
- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices			
Chloride	Melbourne	Nov 19, 2018	28 Day
- Method: LTM-INO-4090 Chloride by Discrete Analyser			
Ferrous Iron - Fe2+	Melbourne	Nov 23, 2018	7 Days
- Method: LTM-INO-4190 Ferrous Iron in Water by Discrete Analyser			
Nitrate (as N)	Melbourne	Nov 19, 2018	28 Day
- Method: APHA 4500-NO3 Nitrate Nitrogen by FIA			
pH (at 25°C)	Melbourne	Nov 20, 2018	0 Hours
- Method: LTM-GEN-7090 pH in water by ISE			
Sulphate (as SO4)	Melbourne	Nov 19, 2018	28 Day
- Method: LTM-INO-4110 Sulfate by Discrete Analyser			
Total Organic Carbon	Melbourne	Nov 19, 2018	28 Day
- Method: APHA 5310B Total Organic Carbon			
Alkalinity (speciated)	Melbourne	Nov 20, 2018	14 Day
- Method: APHA 2320 Alkalinity by Titration

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Hi Nibha,

Just confirming the water samples received today for 55073 are on 24 hr tat.

I forgot to double check the COC.

Rohan

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 10.1 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Rohan Hammond - rhammond@jbsg.com.au.

Note: A copy of these results will also be delivered to the general JBS & G Australia (NSW) P/L email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
BTEX	Melbourne	Nov 22, 2018	14 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

CERTIFICATE OF ANALYSIS 205736

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	C Bennett, Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**55073, Penrith**
Number of Samples	1 Water, 1 Carbon Tube
Date samples received	15/11/2018
Date completed instructions received	15/11/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	22/11/2018
Date of Issue	22/11/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris Guo, Senior Chemist, Air
Jeremy Faircloth, Organics Supervisor
Nick Sarlamis, Inorganics Supervisor
Steven Luong, Senior Chemist

Method ID	Methodology Summary
AT-006	Dissolved gases determined by GC-FID using method USEPA SOP RSK175
AT-008	Determination of volatile organic compounds in charcoal tubes/badges/sorbents using CS2 extraction, based on NIOSH methods. Desorption efficiencies are not applied to results in ug/tube. Note where µg/m^3 results are supplied for SKC badges, the factors used are for 575-001, if 575-001 data is unavailable for an analyte then use 575-002 then 575-003 (exposure time must be supplied).
Inorg-001	pH - Measured using pH meter and electrode in accordance with APHA latest edition, 4500-H+. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-006	Alkalinity - determined titrimetrically in accordance with APHA latest edition, 2320-B.
Inorg-055	Nitrate - determined colourimetrically. Soils are analysed following a water extraction.
Inorg-076	Ferrous Iron is determined colourimetrically by discrete analyser.
Inorg-079	TOC determined using a TOC analyser using the combustion method. Dissolved requires filtering prior to determination. Analysis using APHA latest edition 5310B.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA latest edition, 4110-B. Alternatively determined by colourimetry/turbidity using Discrete Analyer.
Org-013	Water samples are analysed directly by purge and trap GC-MS.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

SAMPLE RECEIPT ADVICE

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	C Bennett, Rohan Hammond

Sample Login Details

Your reference	55073, Penrith
Envirolab Reference	205736
Date Sample Received	15/11/2018
Date Instructions Received	15/11/2018
Date Results Expected to be Reported	22/11/2018

Sample Condition

Samples received in appropriate condition for analysis	YES
No. of Samples Provided	1 Water, 1 Carbon Tube
Turnaround Time Requested	Standard
Temperature on Receipt (°C)	1.2
Cooling Method	Ice
Sampling Date Provided	YES

Comments

Nil

CERTIFICATE OF ANALYSIS 205744

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Rohan Hammond
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**Penrith**
Number of Samples	4xAir
Date samples received	16/11/2018
Date completed instructions received	16/11/2018

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	23/11/2018
Date of Issue	21/11/2018

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris Guo, Senior Chemist, Air

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Acceptable Variation*		+/-10%	+/- 0.2 °C	+/-0.1 pH	+/-5%	+/-10mV	**Results Acceptable: YES / NO**

LOW FLOW: Typical flow rate = 0.2- 0.4 L/min - Max. drawdown = 0.1 m - Well stable when 3 consecutive readings (either 3min apart or 1L apart)

PURGE: Min. sampling volume is 4 casing volumes or dry twice - 1 casing volume (50mm wells) = 2 L/m - 1 casing volume (100mm wells) = 8 L/m

Clarity:	very turbid	**Sheen:**	YES / (NO)
Colour:	orangy brown	**Odour:**	YES / (NO)

Primary sample ID:		**No.**	**Container / Preservative**
Duplicate sample:	YES / (NO) ID:		4x vials
Triplicate sample:	YES / (NO) ID:		
Rinsate sample:	(YES) / NO ID:		
Sample on ice:	(YES) / NO		
Field Filter Method:	0.45µm Filter / (Not Filtered)		
Water Quality Meter:	YSI		
Guaging Equipment:	IP		
Pump Type:	bladder		

Notes:

Calculated Well Volume (L) = Water Column Depth (m) * Conversion Factor (from table)

Casing Diameter	25mm	50mm	100mm	150mm	300mm
Conversion Factor	0.98	1.96	7.85	49.1	196.3

Volume of water in well (L) = π * radius of gravel pack $(m)^2$ * height of water column (m)

*SA EPA Guidelines (June 2007) as referenced in NEPM

IDCJDW2111.201804 Prepared at 13:00 UTC on Monday 21 May 2018

Source of data

Observations were drawn from Penrith Lakes AWS {station 067113}.
You should read the **important information** in these notes.

Other formats

To **print** this page, get the PDF version (one page, 45 kb).
To use this page in a **spreadsheet**, get the plain text version (4 kb).

Other times and other places

The **last 14 months** of Daily Weather Observations for Penrith, New South Wales are also here on this web site:

May 18 Apr 18 Mar 18 Feb 18 Jan 18 Dec 17 Nov 17 Oct 17
Sep 17 Aug 17 Jul 17 Jun 17 May 17 Apr 17

Daily Weather Observations are also routinely prepared for hundreds of **other locations** in New South Wales and across Australia. To get other months or places not on this web site, contact us.

Climate statistics

If you are after **long-term averages** relevant to Penrith, New South Wales, look at the tables for Penrith Lakes AWS, Richmond RAAF, Sydney Airport AMO, Parramatta North (Masons Drive) or Prospect Reservoir.

Maps and tables of average conditions for locations across Australia are also available.

More information

If you are using these pages, you are deemed to have understood the **important information** in these notes. They cover how the data are obtained, how they are processed, and what each column means.

If you have **any questions** about this product, or you want any other weather or climate information, please contact us.

This page was created at **on**

IDCJDW2111.201805 Prepared at 23:36 UTC on Monday 21 May 2018

Source of data

Observations were drawn from Penrith Lakes AWS {station 067113}.
You should read the **important information** in these notes.

Other formats

To **print** this page, get the PDF version (one page, 45 kb).
To use this page in a **spreadsheet**, get the plain text version (4 kb).

Other times and other places

The **last 14 months** of Daily Weather Observations for Penrith, New South Wales are also here on this web site:

May 18 Apr 18 Mar 18 Feb 18 Jan 18 Dec 17 Nov 17 Oct 17
Sep 17 Aug 17 Jul 17 Jun 17 May 17 Apr 17

Daily Weather Observations are also routinely prepared for hundreds of **other locations** in New South Wales and across Australia. To get other months or places not on this web site, contact us.

Climate statistics

If you are after **long-term averages** relevant to Penrith, New South Wales, look at the tables for Penrith Lakes AWS, Richmond RAAF, Sydney Airport AMO, Parramatta North (Masons Drive) or Prospect Reservoir.

Maps and tables of average conditions for locations across Australia are also available.

More information

If you are using these pages, you are deemed to have understood the **important information** in these notes. They cover how the data are obtained, how they are processed, and what each column means.

If you have **any questions** about this product, or you want any other weather or climate information, please contact us.

IDCJDW2119.201805 Prepared at 23:36 UTC on Monday 21 May 2018

Source of data

Temperature, humidity, wind, pressure, cloud and rainfall observations are from Richmond RAAF {station 067105}. Evaporation observations are from Richmond - UWS Hawkesbury {station 067021}.

These evaporation observations will generally be available about month after they are made.

You should read the **important information** in these notes.

Other formats

To **print** this page, get the PDF version (one page, 45 kb).

To use this page in a **spreadsheet**, get the plain text version (4 kb).

Other times and other places

The **last 14 months** of Daily Weather Observations for Richmond, New South Wales are also here on this web site:

May 18 Apr 18 Mar 18 Feb 18 Jan 18 Dec 17 Nov 17 Oct 17
Sep 17 Aug 17 Jul 17 Jun 17 May 17 Apr 17

Daily Weather Observations are also routinely prepared for hundreds of **other locations** in New South Wales and across Australia. To get other months or places not on this web site, contact us.

Climate statistics

If you are after **long-term averages** relevant to Richmond, New South Wales, look at the tables for Richmond RAAF, Richmond - UWS Hawkesbury, Richmond RAAF, Sydney Airport AMO or Prospect Reservoir.

Maps and tables of average conditions for locations across Australia are also available.

More information

If you are using these pages, you are deemed to have understood the **important information** in these notes. They cover how the data are obtained, how they are processed, and what each column means.

If you have **any questions** about this product, or you want any other weather or climate information, please contact us.

Nonparametric Background Statistics for Uncensored Full Data Sets

User Selected Options	
Date/Time of Computation	25/05/2018 15:48
From File	WorkSheet.xls
Full Precision	OFF
Confidence Coefficient	95%
Coverage	95%
Number of Bootstrap Operations	2000

Lead

General Statistics

Total Number of Observations	40	Number of Distinct Observations	30
Minimum	5	First Quartile	9.75
Second Largest	430	Median	20.5
Maximum	910	Third Quartile	59.75
Mean	71.47	SD	156.8
Coefficient of Variation	2.194	Skewness	4.448
Mean of logged Data	3.274	SD of logged Data	1.274

Critical Values for Background Threshold Values (BTVs)

Tolerance Factor K (For UTL)	2.117	d2max (for USL)	2.868

Nonparametric Distribution Free Background Statistics
Data do not follow a Discernible Distribution (0.05)

Nonparametric Upper Limits for Background Threshold Values

Order of Statistic, r	40	95% UTL with 95% Coverage	910
Approximate f	2.105	Confidence Coefficient (CC) achieved by UTL	0.871
95% Percentile Bootstrap UTL with 95% Coverage	910	95% BCA Bootstrap UTL with 95% Coverage	910
95% UPL	420.5	90% Percentile	120
90% Chebyshev UPL	547.8	95% Percentile	249.5
95% Chebyshev UPL	763.5	99% Percentile	722.8
95% USL	910		

Note: The use of USL to estimate a BTV is recommended only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

97.5% Chebyshev(Mean, Sd) UCL	229.6	99% Chebyshev(Mean, Sd) UCL	310

Suggested UCL to Use

95% H-UCL	185.5

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). However, simulations results will not cover all Real World data sets.
For additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Executive Summary

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (Penrith, the client) to provide environmental consultancy services associated with the proposed redevelopment of the Penrith City Village Park (PCPV). It is understood that the client is proposing to develop the western portion of PCPV (herein, referred to as the 'site') for contemporary public open space.

Historical investigations identified potential areas of environmental concern (AEC), including chlorinated ethene (CE) impacts underlying the former dry cleaner located at Shop 3 Gaymark Lane (herein referred to as AEC1) that requires remediation prior to the redevelopment of the site. As such, the objectives of this investigation were to refine the extent of soil remediation works as related to CE impacts (at AEC 1) to facilitate remedial works planning. It is noted that JBS&G (2020[1]) prepared a Sampling, Analysis and Quality Plan (SAQP) detailing the sampling required and methods to be used for undertaking the pre-remediation investigation, however due to tenants still occupying a significant portion of the commercial spaces within AEC1, not all the sampling could be completed in accordance with the SAQP. As such, additional assessment (prior to remediation works) in accordance with the SAQP, will be required to further refine the extent of CE impacts at AEC1 that will require remediation. The results detailed herein have been presented to facilitate remedial works planning.

Based on the data presented herein and subject to the limitations presented in **Section 12**, the following conclusions are made:

- Consistent with historical investigations, elevated levels of tetrachloroethylene (PCE) and trichloroethylene (TCE) were reported in sub-slab vapour at sample locations underlying Shop 3 Gaymark Lane (as represented by SS01 to SS09). Conversely, the levels of TCE and PCE within samples at locations within the western portion of AEC1 (SV12 to SV18) were below laboratory detection limits, providing evidence that soil vapour has not migrated to this lateral extent. On this basis, the inferred lateral extent of CE impacted soils acting as potential source material (to soil vapour) and requiring remediation has been refined to an area of approximately 650 m^2 as shown on **Figure 5**. Additional assessment, as outlined herein will likely further refine this inferred lateral remediation extent.
- To inform the likely depth of CE source material, JBS&G installed soil vapour probes at depths of 1 m and 4 m at locations SV10 and SV11. At both locations, elevated levels of TCE and PCE were detected in the shallow probe (1 m) but below detection limits in the deeper probes (4 m). This data provides evidence that the low permeability clay soils at the site have retarded the vertical migration of these impacts at the site. This is concordant with the visually observed depth of more permeable fill material overlying residual clays and the detection of PCE within the shallow soil sample SV11 0.2-0.3 (2.2 mg/kg) that was in turn, reported at below detection limits in all underlying soil samples. Additional assessment, as outlined herein will likely further refine this inferred vertical remediation extent.
- The leachable concentration (via Australian Standard Leaching Procedure, ASLP) of all VOCs in each soil sample selected for analysis (including SV11 0.2-0.3) were below the laboratory LOR, indicating the CE impacts at AEC1 appear to be largely non-leachable at the locations assessed and therefore unlikely to present an on-going risk to groundwater.
- Based on the total contaminant concentrations and leachable concentrations (via toxicity characteristic leaching procedure, TCLP) within samples collected from in-situ materials assessed herein and comparison to NSW EPA (2014) assessment criteria identified that the

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

fill based soils at the site are largely consistent with a preliminary waste classification of General Solid Waste (GSW).

- Additional assessment is required to further refine the lateral and vertical extent of source materials within AEC1 that will require remediation. In addition, the additional investigations will require to assess the extent of CE impacts within underground service trenches within AEC1, where the former site operator potentially disposed of dry-cleaning fluids that historically caused environmental impacts (potentially to depth). The additional investigations are proposed to be completed when the commercial tenants (within the area of AEC1) vacate the properties prior to remediation works.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

1. Introduction

1.1 Background

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (Penrith, the client) to provide environmental consultancy services associated with the proposed redevelopment of the Penrith City Village Park (PCPV). It is understood that the client is proposing to develop the western portion of PCPV (herein, referred to as the 'site') for contemporary public open space. The site area is shown on **Figures 1** and **2.** In addition, the address and legal identification of each property within the site is provided in **Table 2.1**.

Historical investigations identified potential areas of environmental concern (AEC), including chlorinated ethene (CE) impacts underlying the former dry cleaner located at Shop 3 Gaymark Lane (herein referred to as AEC1) that requires remediation prior to the redevelopment of the site. An overarching Remedial Action Plan (RAP) (JBS&G 2019a[2]) for the whole PCPV site was previously prepared to facilitate feasibility planning and costing for the overall development. Upon development of detailed design plans and establishment of project staging, detailed Remedial Works Plans (RWPs) were intended to be prepared to facilitate the staged remediation of specific portions of the PCPV site.

The RAP (JBS&G 2019a) identifies that soil, groundwater and soil vapour in the area of the former dry cleaner (134-138 Henry Street) is contaminated with chlorinated ethenes (principally trichloroethylene (TCE) and tetrachloroethylene (PCE)). The RAP (JBS&G 2019a) further identifies the preferred remediation methodologies for the identified impacts within Shop 3 Gaymark Lane (referred to as AEC1) – comprising either excavation and off-site disposal or on-site treatment of the impacted soils. However, given that only limited sampling has previously occurred in this portion of the site, the required remedial extent has previously not been defined.

The RAP (JBS&G 2019a) provides the requirement for a pre-remediation investigation to allow collection of data on a scale consistent with the proposed land-use, refine the remediation extent, and facilitate the selection of the preferred ex-situ soil treatment technology or off-site disposal requirements. JBS&G (2020[3]) prepared a Sampling, Analysis and Quality Plan (SAQP) detailing the sampling required and methods to be used for undertaking the pre-remediation investigation.

This investigation was undertaken generally in accordance with NSW EPA published or endorsed guidelines.

1.2 Objectives

The objectives of the investigation were to refine the extent of soil remediation works as related to CE impacts (at AEC 1) to facilitate works planning in accordance with the RAP (JBS&G 2019a).

1.3 Proposed Development

Review of the design plans (**Appendix C**) indicate that the site will comprise a large open recreational space. The park is envisaged to comprise a mixture of paved and grassed areas including shallow/deep planted gardens and water features. Importantly, there will be no enclosed structures with the exception of the amenities building located in the south-eastern portion of the site which will contain toilets, change and storage rooms.

2. Site Condition and Surrounding Environment

2.1 Site Identification

The site location is shown on **Figure 1**. The extent of the site and associated cadastral boundaries are shown on **Figure 2**. The site details are summarised in **Table 2.1** and described in detail in the following sections.

Table 2.1: Summary Site Details

Property Identification and Street Addresses	The site is comprised of the following legal properties: • Lot 1 in DP 164798 – 134 to 138 Henry Street • Lot 10 and 11 in DP 553665 – 140 to 142 Henry Street • Lot 2 in DP 556075 – 144 Henry Street • Lot 3 in DP1200790 – 42 to 44 Station Street • Lot 1 in DP 526304 – 48 to 50 Station Street • Lot E in DP 163176 – 46 Station Street In addition, the site area includes portions of the Allen Place Car Park.
Local Government Authority	Penrith City Council
Approximate MGA Coordinates (MGA 56)	Easting: 286582.2 Northing: 6262912.7
Site Zoning	Commercial Core (B3) and Public Recreation (RE1) under Penrith Local Environmental Plan (LEP) 2010
Current Use	Commercial (car parking, retail and services)
Previous Use	Commercial/industrial (car parking, dry cleaning and general retail/services) and residential
Proposed Use	Public open space
Site Area	Approximately 0.71 ha

2.2 Site Description

The key features from the areas that form the focus of this pre-remediation investigation are discussed in the following sections and shown on **Figure 2**. Observations were made by an experienced JBS&G consultant on 18 May 2020 during an inspection of accessible areas of the site.

2.2.1 The Dry Cleaner, 134-138 Henry Street, Penrith

The former dry cleaner comprised the northern third of the building (referred to as Shop 3, Gaymark Lane) located at 134-138 Henry Street, Penrith. The shop-front occupied most of the building footprint (>85 %), with the remainder comprising a secluded water closet, storage space and point of sale. The premise was vacant during the period of the investigation.

The water closet comprised a small (<3 m^2), fully enclosed space which was serviced by two separate sewerage disposal points. Detergents, household solvents and soaps were observed to be stored within the water closet. The shop-front was serviced by an air exchange (air-conditioning) unit which was observed to be operational during each visit to the premises.

In the alleyway between the dry cleaner and Shop 3 (140 Henry Street, described below), numerous services were present (as shown on **Figure 4d**). Sewerage infrastructure and stormwater pipes ran in a north to south orientation, connecting stormwater and sewerage pipes to the greater system, south of the premises. Services were noted to comprise a mixture of terracotta and polyvinyl chloride (PVC) pipes.

The southern portion of 134-138 Henry Street was inaccessible during the period of the investigation, in which it is noted a café was operating.

2.2.2 Shop 3, 140 Henry Street, Penrith

None of the building spaces located on 140 Henry Street were accessible during the period of the investigation due to business/tenants still operating. Therefore, the observations described below

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

are based on an inspection by a suitably qualified and experienced JBS&G environmental consultant conducted on 3 May 2018 and detailed in the RAP (JBS&G 2019a).

Shop 3 comprised the southern half of the building located at 140 Henry Street, Penrith. The shop was partitioned into four rooms and a water closet, joined by a central hallway. The premises housed an alternative health centre at the time of the inspection.

The shop-front rooms were serviced by air exchange units (air conditioners) which were observed to be in operation during each site visit. The water closet comprised a small (<5 m^2), fully enclosed space which was serviced by two separate sewerage disposal points.

An inspection of the property revealed the presence of household cleaning and medical products: limescale solvents, surface cleaners, stain removers, methylated spirits, polishes, pest control products, ethanol-based surface wipes and carpet deodorisers.

2.3 Surrounding Land Use

The land uses of adjacent properties or properties across adjacent roads at the time of inspection are summarised below.

- North – The site is bound to the north by Henry Street and then numerous commercial premises including UFC Gym, Queens of Hearts Community Foundation and Nepean College. Further north is an open carpark and commercial premises on Belmore Street, including Bob Jane T-Marts and a veterinary hospital;
- East – To the east of the subject site is the remaining PCPV area comprising Gaymark Lane and commercial properties beyond. It is noted that a former service station is located directly east of Gaymark Lane in which the RAP (JBS&G 2019a) identifies that as an area of environmental concern (AEC);
- South – The site is was bound to the south by Allen Place, following which are multiple commercial properties including cafes, a medical centre and pharmacy. Beyond High Street commercial premises are present; and
- West – The site is bound to the west by Station Street, then medium to high density commercial premises. Further to the west is Peach Tree Creek and eventually the Nepean River.

2.4 Topography

Review of topographic information obtained from the Spatial Information Exchange Viewer, LPI (2015[4]) regional topographic map indicated that the site surfaces have an elevation of approximately 30 m Australian Height Datum (AHD). The site generally slopes downwards to the west, towards the Nepean River.

Site inspection confirmed that the topography on site was not significantly altered from the natural alignment and sloped slightly downward toward the western boundary, Station Street. A local ridge line existed which dissected the Allen Place Car Park in an approximately west to east alignment, with site surfaces sloping downwards perpendicular to the ridge line.

2.5 Geology and Soils

Reference to the 1:100 000 Geological Series Sheet for Penrith, DMR (1991[5]) indicates that the site is underlain by Bringelly Shale of the Wianamatta Group originating from the Middle Triassic epoch. This unit is comprised of shale, carbonaceous claystone, claystone, laminite, fine to medium-grained

[4] *'Spatial Information Exchange Viewer'*, NSW Land and Property Information, Accessed 4 January 2018, https://maps.six.nsw.gov.au/;
[5] '*Penrith 1:100 000 Geological Series Sheet 9030 (Edition 1)'.* Department of Mineral Resources, 1991, DMR (1991);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

lithic sandstone, rare coal and tuff. Bringelly Shale is underlain by Ashfield Shale and, at depth, Hawkesbury Sandstone.

Reference to the 1:100 000 Soil Landscape Series Sheet for Penrith, DMR (1990[6]) indicates that the site is within the Richmond Soil Landscape group. This group of landscape is characterised by quaternary terraces of the Nepean and Georges Rivers. Relatively flat (slopes <1 %) and level. Splays, levees provide local relief of <3 m. Formerly a low open woodland. Richmond soils are poorly structured orange to red clay loams, clays and sands. Texture may increase with depth. Ironstone nodules may be present. Plastic clays in drainage lines, red earths and red podzolic soils occur on terrace surfaces with earthy sands on terrace edges. Limitations of the Richmond group include high erosion hazard on terrace edges and minor localised flooding.

The lithology observed during previous investigations (PSM 2017[7], JBS&G 2017a[8] and 2019b[9]) is as follows:

- Shallow to moderately deep alluvial soils comprising clay to sandy clay (present from a depth of 0.4 m to 10.5 m below ground surface (bgs));
- Moderately deep to deep alluvial clay to sandy clay mixed with Nepean River gravels (present from a depth of 6.1 m to 13.0 m bgs); then
- Residual shale bedrock (present from a depth of 13.0 m to 15.0 m bgs).

2.6 Salinity

Reference to the Department of Infrastructure, Planning and Natural Resources salinity potential map GS912, DIPNR (2002[10]), has indicated that the site exists within an area of 'moderate salinity potential'.

Vegetation at the site during the site inspection did not exhibit any indicators of salinity related stress.

2.7 Hydrology

Rainfall is considered likely to migrate primarily through surface water runoff into the municipal stormwater system. Minor infiltration into the underlying porous soils and surface is also expected in areas of unsealed ground.

As discussed in **Section 2.2**, the site is largely covered by concrete, asphaltic pavements and building footprints. As such, surface water generated during periods of rainfall is anticipated to primarily enter the municipal stormwater system; via discharge into onsite stormwater catchment infrastructure or alternatively discharge into stormwater pits within the surrounding roadways.

The nearest water body to the Site is Peach Tree Creek, approximately 1.1 km to the west of the site boundary. Peach Tree Creek ultimately contributes to the Nepean River. Municipal stormwater discharges to the Nepean River.

Version: 1, Version Date: 14/04/2021

2.8 Hydrogeology

Registered groundwater bore information was obtained from the NSW Department of Primary Industries groundwater mapping tools, NSW DPI (2016[11]). A review of the registered bore information indicated that there were thirteen bores within a 1.5 km radius of the Site. Based on the reported geology, topography and depth to groundwater, groundwater migration is expected to occur in a north-westerly direction, towards Peach Tree Creek approximately 1.2 km away. Groundwater has been reported in the surrounding properties within the river gravels layer. The DGI (JBS&G 2019b) reported groundwater depths ranging from 6.96 m to 8.05 m bgs, flowing in a north-westerly direction.

Registered groundwater bores located within a 1.5 km radius of the site are used for monitoring, recreational and testing purposes. Given the relatively dense urban use of the site and surrounding properties, in addition to the identified licensed bores, there is a moderate probability of additional undocumented bores near the site. No reported utilisation of groundwater as a drinking water source has been reported.

2.9 Acid Sulfate Soils

The Guidelines for the Use of Acid Sulfate Soil Risk Maps, Department of Land and Water Conservation (DLWC) (1997[12]), has indicated that acid sulfate soils (ASS) are likely to be located in coastal lowlands up to about 10 m AHD. No risk map for the area encompassing the site was provided as part of the acid sulfate soil risk map series, DLWC (1998). Review of the geographical and topographical location of the site has indicated that it is a significant distance away from tidal creeks or estuaries, and it is considered unlikely that ASS would exist at the site.

Three planning certificates were obtained for the site, provided in the DSI (JBS&G 2017a). The land was not identified to have been affected by a policy adopted by Council or adopted by any other public authority, notified to Council, that restricts the development of the land because of the likelihood of ASS.

No staining, odours or other indicators of ASS were observed during the DSI or DGI (JBS&G 2017a and 2019b).

2.10 Meteorology

A review of average climatic data for the nearest Bureau of Meteorology monitoring location (Penrith Lakes[13]) indicates the site is located within the following meteorological setting:

- Average minimum temperatures vary from 5.5 ^{o}C in July to 18.5 ^{o}C in January;
- Average maximum temperatures vary from 17.7 ^{o}C in July to 30.7 ^{o}C in January;
- The average annual rainfall is approximately 728.1 mm with rainfall greater than 1 mm occurring on an average of 71.7 days per year; and
- Monthly rainfall varies from 30.6 mm in September to 121.4 mm in June with the wettest periods occurring on average in January to June.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Conceptual Site Model

Given that this pre-remediation investigation is largely focussed on addressing AEC 1 (as discussed in **Section 5**), the CSM presented below largely focusses on this portion of the subject site.

3.1 Overview

NEPC (2013) identifies a CSM as a representation of site related information regarding contamination sources, receptors and exposure pathways between those sources and receptors. The development of a CSM is an essential part of all site assessments.

NEPC (2013) identified the essential elements of a CSM as including:

- Known and potential sources of contamination and contaminants of concern including the mechanism(s) of contamination;
- Potentially affected media (soil, sediment, groundwater, vapours etc.);
- Human and ecological receptors;
- Potential and complete exposure pathways; and
- Any potential preferential pathways for vapour migration (if potential for vapours identified).

3.2 Potentially and Contaminated Media

Areas of environmental concern for the subject site are shown on **Figure 3**. Potential and known contaminated media comprise:

- Fill materials;
- Underlying natural soils;
- Subsurface vapour and ground gases; and
- Groundwater

Table 6.1 Areas of Environmental Concern and associated Contaminants of Potential Concern

Areas of Environmental Concern (AEC)	Contamination Status	Potentially Contaminated Media	Contaminants of Potential Concern (COPC)
AEC 1 – Former Dry Cleaner 134-138 Henry Street (Lot 1 DP164798) Improper disposal/management of dry-cleaning chemicals	Known	Soil, groundwater, soil-vapour and indoor air	Chlorinated Ethenes (PCE, TCE, DCE)
AEC 3 – Transformers Historical spillage/leakage of transformer oils underlying transformers within the Allen Place carpark.	Potential	Soils	TRHs and PCBs
AEC 4 – Fill material Underlying Buildings Fill materials of unknown origin used for site levelling and activities associated with development. Application of COPCs as a result of general maintenance during site occupation (pesticides, herbicides, fuel and oil spills etc).	Potential	soils	Heavy metals, PAHs, TRH, BTEX, OCPs, PCBs, VOCs and asbestos

3.2.1 AEC 1 Former Dry Cleaner

Soil, soil vapour and groundwater samples obtained during the DSI (JBS&G 2017a) and DGI (JBS&G 2019a) indicate that the greatest levels of CE impact is in the immediate vicinity 134-138 Henry

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Street and extending north and west of the premises. Detections of contaminant concentrations a considerable distance west of the premises provide evidence that the compounds may have migrated along the inferred sewerage infrastructure alignment. Impacts to site media are detailed in **Section 3.2.1.1** to **Section 3.2.1.4** and previous sampling locations are presented in **Figures 4a** (soil), **4b** (groundwater) and **4c** (soil vapour).

3.2.1.1 Soil Impacts

Soil samples analysed as part of the previous (JBS&G 2017a) and DGI (JBS&G 2019a) have not identified gross and/or widespread soil contamination. No soil samples analysed within the groundwater table, or nearby to sewerage infrastructure were reported to contain COPCs above the laboratory limit of reporting (LOR). Minor concentrations of PCE and TCE at location JHA04, underlying Shop 3/140 Henry Street, were reported in JBS&G (2017a).

Notwithstanding, it is considered likely that soils surrounding the sewerage infrastructure, and underlying the dry cleaner, have historically been impacted by dry cleaning solvents. The maximum levels of TCE reported in sub slab vapour are consistent with a source of chlorinated ethene being present in the unsaturated zone. Chlorinated ethenes can commonly be heterogeneously distributed through a soil profile, and localised within the extent of a sample of soil collected in clay based soils. Due to their characteristics subsurface chlorinated ethene impacted soils are not typically readily identified. Impacted soils are considered to potentially represent an ongoing source of contamination to both groundwater and soil vapour.

3.2.1.2 Groundwater Impacts

Groundwater analytical results indicated that PCE was present at concentrations exceeding the investigation criterion at JBMW02 and JBMW05, and above the laboratory LOR in JBMW03, PSM01 and PSM03. Chlorinated ethenes were not detected in samples of groundwater collected from JBMW01, JBMW04, JBMW06, JBMW07 or PSM02. Trace concentrations of TCE in groundwater were reported at locations JBMW02 (0.002 mg/L to 0.009 mg/L), JBMW05 (0.002 mg/L) and PSM01 (0.001 mg/L).

It is noted that JBMW02 and JBMW05 are over the northern boundary of the site, providing evidence that the impact has migrated off the site via the groundwater. No groundwater monitoring wells have been installed directly into the chlorinated ethene impact source zone, although it is considered likely that the highest concentrations of chlorinated ethenes will be present directly underneath the dry cleaner.

Impacts to groundwater have been delineated north (JBMW06 and JBMW07), east (JBMW03), south (PSM02) and west (JBMW01 and JBMW04). Potential remains for groundwater impact to be present further northwest of JBMW05.

3.2.1.3 Soil vapour Impacts

<u>Shallow Soil Vapour</u>

Results obtained from the DGI (JBS&G 2019a) have shown that significant concentrations of PCE and TCE are present within shallow soil vapour (<0.3 m bgl) surrounding the dry cleaner. Soil vapour contaminant samples collected from locations SV11, SV14 and SV16 were reported to have concentrations of CEs above the laboratory LOR. The highest results reported during the current assessment were associated with location SV14, which was placed immediately overlying sewerage infrastructure servicing the dry cleaner. Soil vapour samples collected from locations SV12, SV13, SV15 and SV17 were not reported to have any VOCs above the laboratory LOR.

Within samples where both TCE and PCE were detected above the laboratory LOR, the ratio of PCE/TCE ranged from 4.143 to 14.49.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The distribution of CEs in soil vapour has provided evidence that the compounds have migrated within/alongside the sewerage infrastructure a considerable distance from the dry cleaner (>50 m). In addition, impacted soil vapour may be migrating over the northern boundary of the site, as indicated by elevated concentrations in SV11.

The investigation results indicate that the occurrence of CEs in shallow soil-vapour is not strongly correlated with presence in groundwater. Whilst volatilisation of CEs from groundwater is likely to be occurring, it is considered unlikely that it is occurring at a level which represents a risk to future site users on the basis of the following considerations.

- SV09 contained no soil vapour concentrations above the laboratory LOR with elevated underlying groundwater impact (PSM01, 0.033 mg/L to 0.059 mg/L);
- The largest groundwater impact (JBMW02) was near two soil-vapour sample locations which were reported to contain minimal concentrations (SV11) to no detection (SV12) of CEs in soil-vapour were present;
- SV16 contained elevated concentrations of CEs with no underlying groundwater impact (JBMW04), and the highest reported soil vapour impact is overlying adjacent to the sewerage infrastructure (SV14); and
- Groundwater is in excess of 7 m below the current ground surface.

Deep Soil Vapour

Two deep soil vapour samples were taken north of the former dry cleaner (SV18 and SV19). Samples were collected from 4.7 m to 5.0 m below ground levels. Highly elevated CEs were detected in both samples, exceeding interim HILs:

- SV18: PCE (367 mg/m^3) and TCE 1.62 (mg/m^3); and
- SV19: PCE (1300 mg/m^3) and TCE 8.83 (mg/m^3).

These results are indicative of the presence of contamination at beneath/adjacent to the former dry cleaners at depth. The relatively low concentrations in groundwater indicate that the deep source is unlikely to be present in the saturated zone. Additional assessment will be required to determine the extent of remediation required to address the presence of elevated CE in deep offsite soil vapour.

3.2.1.4 Indoor Air

Indoor air was sampled over four monitoring events (9 and 17 April 2018, 3 May 2018 and 15 November 2018). Samples analysed from Shop 3/134-138 Henry Street and Shop 3/140 Henry Street have indicated that the PCE is present within the indoor air of both premises. TCE was generally not detected above the laboratory limit of reporting in the analysed samples, with the notable exception of 140_SHOP on 9 April and 3 May 2018. **Table 3.2** and **Table 3.3** show ratios of indoor air to sub-slab vapour concentrations, and relative PCE to TCE concentrations within samples.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 3.2: Indoor Air and Sub-Slab VOC Concentrations

Sample Location	Highest Indoor Air Concentration (µg/m³)	Closest Sub-Slab Soil Vapour Concentration (µg/m³)	Indoor Air to Sub-slab Soil Vapour Ratio
Tetrachloroethene			
140_BATH	<3	14 500 (SV10)	<0.00021
140_SHOP	5	14 500 (SV10)	0.00035
DC_BATH	8	40 000 (SV14)	0.00020
DC_SHOP	8	40 000 (SV14)	0.00020
Trichloroethene			
140_BATH	<2.7	3500 (SV10)	<0.00077
140_SHOP	20	3500 (SV10)	0.00571
DC_BATH	<2.7	2760 (SV14)	<0.00098
DC_SHOP	<2.7	2760 (SV14)	<0.00098

Table 3.3: PCE to TCE Ratio in Site Media

Sample Location	Highest PCE Concentration (µg/m³)	Highest TCE Concentration (µg/m³)	Ratio of PCE/TCE	Approximate Distance From Shop 3/140 Henry Street / Distance From Shop 3/134-138 Henry Street (m)
Indoor Air				
140_BATH	<3	<2.7	-	Internal
140_SHOP	5	20	0.250	Internal
DC_BATH	8	<2.7	>2.963	Internal
DC_SHOP	8	<2.7	>2.963	Internal
Sub-Slab				
SV05	56 667	9333	6.072	<5 / 20
SV10	14 500	3500	4.143	Underlying / 15
SV14	40 000	2760	14.49	Boundary / < 5
SV16	1520	168	9.047	30 / 40

One reported concentration of TCE within indoor air sample 140_SHOP, 9 April 2018 (20 µg/m³), was inconsistent with the subsequent three samples taken at the same location, 17 April 2018 (<2.7 µg/m3),3 May 2018 (5 µg/m³) and 15 November 2018 (<2.7 µg/m³).

The ratio between TCE and PCE in this indoor sample was significantly different to all sub-slab soil vapour samples in which both TCE and PCE were detected. On this basis, the elevated concentration is considered likely to be the result of an additional, internal source within the premises, and is not considered to be reflective of CE advection from the sub-slab soil vapour.

3.3 Potential for Migration

Contaminants generally migrate from site via a combination of windblown dusts, rainwater infiltration, groundwater migration and surface water runoff. The potential for contaminants to migrate is a combination of:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- The nature of the contaminants (solid/liquid and mobility characteristics);
- The extent of the contaminants (isolated or widespread);
- The location of the contaminants (surface soils or at depth); and
- The site topography, geology, hydrology and hydrogeology.

The contaminants of concern identified in JBS&G (2017, 2019a and 2019b) are generally in solid (e.g. asbestos, metals and PAHs), liquid (e.g. VOCs, TPH and BTEX) or gaseous (e.g. VOCs, BTEX, Volatile TRH) form.

As the ground surfaces across the current site layout primarily comprise sealed asphalt or concrete pavements and building footprints, the potential for windblown dust migration of contamination is generally low. The potential for contamination migration via surface water movement and infiltration of water and subsequent migration through the soil profile is considered generally to be low given the extent of impermeable pavements across the site. However, it is noted that during redevelopment of the site for public open space, these migration routes will become a possibility and require consideration in the context of the required remediation (discussed further in **Section 6**).

The underlying natural soils at the site comprise primarily clayey soils and are relatively impermeable. Notwithstanding, CEs have been detected within groundwater (PSM01, JBMW02 and JBMW05). On this basis, migration of contaminants via groundwater movement has been identified at the site.

Analysis of soil-vapour samples collected from shallow soils show that shallow soil vapour impacts are generally limited to 134-138 and 140 Henry Street. Deep soil-vapour samples collected on the northern side of Henry Street indicate that soil vapour impacts are present at depth beyond the northern site boundary. The scale of the impacts and generally low concentrations in groundwater imply the potential for a deep source of CEs in unsaturated horizons of soil potentially underlying Henry Street. Offsite vapour generation and transport is identified as a migration pathway.

3.4 Potential Exposure Pathways

Based on the COPC identified in various media, as discussed above, and proposed development activities, the exposure pathways for the site during and following development works are discussed below.

3.4.1 On-site Recreational Public Open Spaces

Recreational public open spaces comprise areas which will not be used for building development (**Figure 2**) and will cover the site extent. The following exposure pathways are relevant for site receptors within public open spaces:

- Potential dermal and oral contact to impacted soils as present at shallow depths and/or accessible by future service excavations; and/or
- Potential oral and dermal contact to groundwater as accessible by potential future service installation; and/or
- Inhalation of COPC vapours/gases/fibres migrating upwards from current *in-situ* soils/groundwater; and/or
- Potential contaminant uptake by vegetation proposed to be established in the vegetated areas of the site.

3.4.2 Offsite Exposure Pathways

Potential offsite receptors of deep soil vapour impact are identified as basement occupants of 121 Henry Street, Penrith. Potential exposure is through advection of vapours from impacted

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

soils/groundwater into the basement and inhalation by basement occupants. JBS&G (2019b) presents a vapour intrusion assessment, based on current site conditions, which indicates that no unacceptable concentrations of contaminants have been identified in indoor air within the basement of 121 Henry Street.

In the context of the PCPV development, future offsite receptors of soil vapour impact will be those within buildings/basements located within 30 m to the east of the identified impacts of AEC1. Noting that no detailed design plans have been provided for this portion of the PCPV development, the final on-site remedial extent (defined by this pre-remediation investigation) will be required to be cognisant of this potential exposure pathway and its potential implications for future basements/buildings in close proximity to the site.

The DGI provides a discussion of dilution/attenuation of contaminants within groundwater prior to discharge to the receiving water body (Peach Tree Creek), contaminant uptake by sensitive ecological receptors within the water body is considered not to be a potential exposure pathway which warrants further consideration.

Given the character of the groundwater, and the absence of identified groundwater bores within the vicinity of/downgradient of the site, potential beneficial reuse of the groundwater is not anticipated. Additionally, it is noted that groundwater is present at considerable depth below the current ground surfaces (7 to 8 m bgs). However, it has been conservatively assumed that groundwater may be intercepted by during construction of future basements within the residential/commercial precinct.

3.5 Receptors

Potential receptors of environmental impact present within the site which will require to be addressed include:

- Future site users who may potentially be exposed to COPC through direct contact with impacted soils and/or inhalation of vapours associated with impacted soils; and/or
- Excavation/construction/maintenance workers conducting activities at or in the vicinity of the site, who may potentially be exposed to COPC through direct contact with impacted soils/groundwater present within excavations and/or inhalation fibres/vapours associated with impacted soils/groundwater; and/or
- Future excavation/construction/maintenance workers who may potentially be exposed to volatile or semi-volatile COPCs through the inhalation of vapours via migration; and/or
- Current and/or future flora at the site who may be exposed to contaminants via direct uptake into root systems.

3.6 Preferential Pathways

For the purpose of this assessment, preferential pathways have been identified as natural and/or man-made pathways that result in the preferential migration of COPC as either liquids or gases.

Natural preferential pathways are likely limited to natural lithological borders, such as between porous soils and bedrock, where infiltrating groundwater is vertically confined and begins to migrate laterally.

Man-made preferential pathways are present throughout the site, generally associated with sub-surface service easements and areas of previously disturbed fill material.

The sewerage and stormwater infrastructure abutting the western boundary of the former dry cleaner has been identified as a preferential pathway, and is considered likely to have potentially facilitated transport of CEs from the dry cleaner. Preferential pathways can be created by the generally higher permeability fill materials used as backfill to re-instate sub-surface service easements.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Data Gaps

Potential data gaps as identified within the RAP (JBS&G 2019a) within the subject site include:

- **AEC 1** – Greater detail on the vertical and lateral distribution of TCE and PCE source material in soils underlying 134-138 and 140 Henry Street as inferred to be causing elevated levels of soil-vapour impact in shallow soils and at depth on the site.

  Where basements are proposed within 30 m of identified impacts, additional assessment of soil-vapour impacts is required to determine whether potential deep vapour impacts represent a risk to future building developments within PCPV. It is noted that no buildings are proposed within the subject site (apart from the amenities building), however potential basements and buildings will be constructed in the property to the east. On this basis, the risk posed by vapours to adjoining properties requires consideration within this assessment in the context of informing required remedial extents on-site to be protective of future off-site receptors within adjoining basements/buildings.

  As further noted in **Section 1.3,** the site is to be redeveloped for public open space that will result in the removal of all hardstand currently present on-site. This will result in infiltration of water and subsequent migration through the soil profile which may cause on-going impacts to site groundwater in the source area of AEC1.

  On this basis, the pre-remediation investigation within AEC1 is primarily required to inform the remedial extent within soils underlying 134-138 and 140 Henry Street to be protective of future off-site receptors in basements/buildings to the east (within the PCPV development) and removal of on-going source material to groundwater impacts.

- **AEC 3** – Potential occurrence of hydrocarbon impacts within shallow soils underlying transformers within the Allen Place Car Park. It is noted that a single transformer is located within the south-eastern portion of the subject site – in which it is not proposed to complete any assessments until the structure is decommissioned and demolished. On this basis, assessment and validation of this AEC is not the focus of this investigation and will be required to be completed during validation activities for the site; and

- **AEC 4 –** Potential occurrence of localised areas of asbestos impact and/or dissimilar fill characteristics material underlying current hardstand pavements and building footprints. Assessment of this AEC will be completed upon completion of the demolition works and removal of hardstand surfaces. To this extent, assessment of this AEC is not the focus of this investigation and will be required to be completed during validation activities for the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5. Sampling and Analysis Plan

5.1 Data Quality Objectives

Data Quality Objectives (DQOs) established for the pre-remediation investigation are discussed in the following sections.

5.1.1 State the Problem

Remedial works are required for principally chlorinated ethene impact at the site. A refined estimate is required of the extent of soil remediation works to facilitate works planning. Additional data is further required to assess the data gaps identified in **Section 4** with respect to AEC1 such that the RWP can be prepared for the development area.

5.1.2 Identify the Decision

The decisions required to be made for the investigation are:

- Have the identified site-related contaminants (chlorinated ethenes) acting as potential source material been appropriately and sufficiently delineated?
- Can a preliminary waste classification be provided for materials that may require off-site disposal during remediation activities?
- Are there any impacts of chemical mixtures?
- Is further assessment required (i.e. is there enough information to prepare a detailed RWP for the development area)?

5.1.3 Identify Inputs to the Decision

The following inputs are required in order to make the stated decisions:

- Previous environmental data available for the site;
- Installation, sampling and analysis of additional sub-slab and soil vapour probes within the site;
- Installation of soil bores for the collection of data associated with waste classification of soils that may require off-site disposal during remediation works as well as the leachability (and corresponding risk to groundwater) of chlorinated ethenes in source material;
- Laboratory analysis data for COPCs;
- Site assessment criteria for potentially impacted media for COPCs; and
- Confirmation that data generated by sampling and analysis are of an acceptable quality to allow reliable comparison to assessment criteria.

5.1.4 Define the Study Boundary

The lateral extent of the study comprises the site (as shown on **Figure 1**) and occupies an area of approximately 0.53 ha and is shown on **Figure 1**.

A soil and soil vapour assessment was conducted within the boundaries of the site (primarily within AEC1) that comprised the installation of sub-slab vapour probes as well as soil vapour probes installed to a depth of 1 m bgs and 4.0 m bgs.

The temporal boundaries of this investigation were limited to the period of assessment works. Seasonal influences are not considered to have a significant impact on the outcomes of the assessment given that the objective of the investigation was to delineate the extent of CE impacted

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

source material within site soils that will require remediation and not assess potential worst case conditions as applicable to vapour intrusion.

5.1.5 Develop a Decision Rule

A summary of the decision rules to be adopted for each of the environmental issues required to be addressed are outlined in **Table 5.1** below.

Table 5.1: Summary of Decision Rules

Decision Required to be Made	Decision Rule
1. Have the identified site-related contaminants (chlorinated ethenes) acting as potential source material been appropriately and sufficiently delineated?	Has data been collected data at the proposed sample locations? Is the additional data collected within AEC1 sufficient to inform the remedial extent within soils underlying 134-138 and 140 Henry Street to be protective of future off-site receptors in basements/buildings to the east (within the PCPV development) and removal of on-going source material to groundwater impacts? Is the CSM considered to be robust for the purposes of the assessment? That is, has the data provided information on a scale that refines the required remediation extent? If Yes to all, the decision is Yes. Otherwise the decision is No.
2. Can a preliminary waste classification be provided for materials that may require off-site disposal during remediation activities?	Representative fill/soil analytical data will be compared against EPA (2014) criteria. Statistical analysis of the data in accordance with relevant guidance documents will be undertaken, where appropriate, to facilitate the provision of a preliminary waste classification of the materials.
3. Are there any impacts of chemical mixtures?	Are there more than one group of contaminants present which increase the risk of harm? If there is, the decision is Yes. Otherwise, the decision is No.
4. Is further assessment required (i.e. is there enough information to prepare a detailed RWP for the development area)?	Assessed by guidance to other decisions.

5.1.6 Specify the Limits on Decision Error

This step is to establish the decision maker's tolerable limits on decision errors, which are used to establish performance goals for limiting uncertainty in the data. Data generated during this assessment must be appropriate to allow decisions to be made with confidence.

There are two types of decision error identified in Australia Standards (AS) 4482.1-2005 'Guide to the investigation and sampling of sites with potentially contaminated soil Part 1: Non-volatile and semi-volatile compounds.' This includes:

a) Deciding that the site is acceptable when it actually is not; and

b) Deciding that the site unacceptable when it is.

Limits are required to be set on each type of error presented here. AS4482.1-2005 nominates that a 5% probability of (a) and 20% probability of (b). It is noted that the application of this relationship assumes a uniform distribution of impact over the site area.

This is not the case for this site, as the site contamination is inferred to be heterogeneously distributed across the site area. This prevents the ready application of this method. The potential for decision errors are therefore required to be qualitatively estimated. Sampling plans and works have been designed to attempt to minimise potential decision errors relating to these decisions.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Recommendations for management and/or future works are cognisant of the potential errors in the interpretation of site data.

To assess the usability of the data prior to making decisions, the data will be assessed against pre-determined Data Quality Indicators (DQIs) established for the project as discussed below in relation to precision, accuracy, representativeness, comparability and completeness (PARCCS parameters).

The DQIs and data assessment criteria are summarised following and presented in **Table 5.2**:

- **Precision** - measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** - measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** – expresses the degree which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the site, and by using an adequate number of sample locations to characterise the site to the required accuracy.
- **Comparability** - expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples; ensuring analysing laboratories use consistent analysis techniques and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** - expresses the appropriateness of the chosen laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted site assessment criteria.

Table 5.2: Summary of DQIs

Data Quality Objectives	Frequency	Data Quality Indicator
Precision		
Blind duplicates (intra laboratory)	1 / 20 samples	<50% RPD
Blind duplicates (inter laboratory)	1 / 20 samples	<50% RPD
Accuracy		
Surrogate spikes	All organic samples	70-130%
Laboratory control samples	1 per lab batch	70-130%
Matrix spikes	1 per lab batch	70-130%
Representativeness		
Sampling appropriate for media and analytes		-
Samples extracted and analysed within holding times.	-	Soil Organics (7-14 days), inorganics (6 months) Vapour (carbon sorbent tubes) Organics (14 days)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Data Quality Objectives	Frequency	Data Quality Indicator
Trip spike (BTEX only)	1 per sampling event	70-130% recovery
Rinsate blank	1 per sampling event	<LOR
Method blank	1 per lab batch	<LOR
Comparability		
Standard operating procedures for sample collection & handling	All Samples	All samples
Standard analytical methods used for all analyses	All Samples	All samples
Consistent field conditions, sampling staff and laboratory analysis	All Samples	All samples
Limits of reporting appropriate and consistent	All Samples	All samples
Completeness		
Sample description and COCs completed and appropriate	All Samples	All samples
Appropriate documentation	All Samples	All samples
Satisfactory frequency and result for QC samples	All QA/QC samples	-
Data from critical samples is considered valid	-	Critical samples valid
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted Site assessment criteria	All samples	LOR<= Site assessment criteria

Note: Laboratory QA/QC procedures may differ for carbon sorbent tube analysis

5.1.7 Optimise the Design for Obtaining the Data

The purpose of this step is to identify a resource-effective field investigation sampling design that generates data that are expected to satisfy the criteria specified in the preceding steps of the DQO process. This step provides a general description of the activities necessary to generate and select data collection designs that satisfy decision performance criteria.

Delineation of the extent of chlorinated hydrocarbon contamination in soil and soil vapour is required to inform decisions with respect to remediation at the site. This broadly comprised:

- A sub-slab vapour and soil vapour assessment program; and
- A soil assessment program to inform potential waste classification of soils that may require off-site disposal during remediation works as well as the leachability (and corresponding risk to groundwater) of chlorinated ethenes in source material. The locations of the soil assessment were consistent with the deep soil vapour probes within accessible areas in the north-eastern portion of the site.

The following sections detail the investigation approach for the assessment of each media and constituent.

5.2 Sub-slab / Soil Vapour Assessment

Grid-based soil vapour sampling within the source area of AEC1 was completed. The sampling was completed within accessible areas – noting that most of the commercial spaces within AEC1 are currently still tenanted, which precluded access to certain areas for the investigation. The completed sample locations are shown on **Figure 5**.

To inform the likely vertical remedial extent, soil vapour probes were installed to a depth of 1 and 4 m as consistent with the methodology outlined in **Section 5.2.2**. Noting that the sample locations

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

were required to inform the depth of excavation required to be protective of future off-site receptors in potential basements/buildings to the east (within the PCPV development), the probes were installed in accessible areas that contained elevated CE impact (in sub-slab vapour) and towards the eastern boundary of the subject site.

5.2.1 Sub-Slab Vapour Probe Installation

The following methodology was adopted for the installation of sub-slab vapour probes installed across the extent of the source area:

- Record location of probe using GPS;
- Drill a 16 mm diameter hole through the concrete slab which is anticipated to be approximately 150 mm thick;
- Installation of a Vapor Pin metallic probe following the manufacturer's instructions, which briefly comprises hammering the probe with silicone sleeve into the drilled hole to a depth of the encountered slab thickness; and
- Undertake a leak test via the method detailed in **Section 5.2.3**.

5.2.2 Soil Vapour Probe Installation

The following methodology was adopted for the installation of soil vapour probes:

- Record location of borehole using GPS;
- Placement of a 1 m and 4 m deep borehole at each sample location;
- Assessment of drill cuttings using a PID at a frequency of one head space analysis per 0.5 m;
- Discrete soil samples were collected at approximate 1.0 m intervals as per the methods detailed in **Section 5.3;** and
- Installation of soil vapour probe by use of Teflon tubing, consisting of placement of 2mm graded sand adjoining the base of the sample tube, placement of a nominal thickness of bentonite chips overlying the graded sand, completion of borehole by filling with grout / bentonite chips to the site surface.

5.2.3 Soil Vapour Probe / Sub-slab Sampling and Analysis

The following methodology was adopted to sample the sub-slab and soil vapour probes:

- The soil vapour probes were left to equilibrate for a period of at least 24 h before sampling;
- An GFM500 gas detector was then used to purge each probe for a period of approximately 30 seconds. Gas readings were monitored until oxygen and photo-ionisation detector (PID) readings stabilised;
- Following this a leak detection evaluation was completed via placement of an isopropyl alcohol soaked rag within an air tight box containing the sample train over the top of the backfilled borehole, to assess the potential occurrence of leaks whilst the gas detector was used to purge the sample point. Elevated PID readings on the gas detector were assumed to indicate a leaking probe. Any leaking probes were required to be re-installed and re-checked prior to sampling using the same method;
- Following preliminary confirmation of the absence of any significant leaks, the sub-slab vapour samples were collected onto SKC-Anasorb carbon tubes. An isopropyl alcohol saturated rag was maintained in an airtight box (sealed container containing sample train) throughout purging and sampling for laboratory confirmation of potential leaks. A shroud was used in the chamber to maintain an isopropyl alcohol rich atmosphere over the

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

sampling location. At all sample locations, a 6.3L volume was collected using a calibrated pump at a flow rate of 210 mL/min (30 min sample time) onto a carbon tube;

- Following sample collection, the carbon tubes were removed and capped and stored in a cool dry and dark container that excludes light, prior to analysis in accordance with the laboratory schedule in **Table 5.3**.
- Blind and split duplicate samples were collected by splitting the primary sample tubing into two ports to allow for the collection of the primary and duplicate samples at the same time. Blind and split duplicate samples were collected at a rate of 1/20 primary samples.

5.3 Soil Assessment

Soil samples were collected via push tube using a Geoprobe track mounted drilling rig at the nominated borehole locations for the installation of deep soil vapour probes. Soil samples were collected directly underneath the hardstand (concrete) then generally at 0.5-1.0 m intervals to a maximum depth of 4 m. During the collection of soil samples, features such as seepage, discolouration, staining, odours and other indicators of contamination were noted.

Soil samples will be screened on site during works using a PID to assess the potential presence of VOCs including TCE and PCE. Collected samples were immediately transferred to laboratory supplied sample jars (additional 500 mL plastic bags will be used where asbestos analysis is required). The sample jars/bags were then transferred to a chilled ice box for sample preservation prior to and during shipment to the testing laboratory. A chain-of-custody form will be completed and forwarded with the samples to the testing laboratory.

Duplicate soil samples were collected at a rate of one per 20 primary samples. Duplicate samples were collected for QA/QC purposes from the push tube by taking discrete soil samples and placing directly into the sample jars. Samples were not mixed prior to placement into the jars to minimise the potential for loss of volatiles. Similarly, where 500 mL samples were required for duplicate asbestos analysis - no mixing of material was undertaken prior to placement into plastic bags to prevent the loss of free fibres. It is noted that this methodology may result in the calculation of poor RPDs but this is considered acceptable given that the loss of volatiles/fibres may result in the reporting of lower contaminant concentrations than actually present. A trip spike (BTEX only) was collected with each batch of samples.

Not all soil samples collected were analysed. Soil samples were analysed in accordance with the sampling and analytical program (**Table 5.3**).

5.4 Analytical Schedule

JBS&G will contract Eurofins/mgt (Eurofins) as the primary laboratory, with Envirolab Services (Envirolab) as the secondary laboratory. Both laboratories are NATA registered for the required analyses. In addition, the laboratories will be required to meet JBS&G's internal QA/QC requirements.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 5.3: Analytical Schedule

Sample Type	No. of Sampling Locations	Analyses (exc. QA/QC)
Sub-slab/soil vapour	20 soil vapour (16 sub-slab + 4 deep soil vapour probes).	VOC-8260 – 20 samples Isopropanol – 20 samples

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6. Assessment Criteria

6.1.1 Vapour Assessment Criteria

In order to assess the human health risks associated with chlorinated ethenes within the source area, concentrations in sub-slab and soil vapour were screened against published levels as sourced from Table 1A(2) in NEPC (2013) and applicable to recreational land-use.

6.1.2 Leachability Assessment

The guidelines considered relevant to the assessment of source material retention on site and the corresponding risk to groundwater are the values provided to ANZG (August 2018[14]) for freshwater ecosystems protective of 95% of species. Modification of the generic screening values to incorporate attenuation and dilution of contaminant levels due to groundwater flow and mixing processes that occur in the discharge zone may be appropriate, subject to further review and justification if required.

6.1.3 Waste Classification Assessment

To address the assessment objective for the provision of a preliminary waste classification of fill/soil materials at the site, laboratory analysis data were compared to threshold concentrations (total and leachable concentrations) published in NSW EPA guidance documentation presented in *NSW EPA Waste Classification Guidelines, Part 1: Classifying Waste* (EPA 2014a[15]).

[14] Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, August 2018)

[15] *Waste Classification Guidelines, Part 1: Classifying Waste,* NSW Environment Protection Authority, November 2014 (EPA 2014a)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. Quality Assurance / Quality Control

Given the limited sampling completed to date, a detailed review of the DQIs in accordance with **Section 5.1.6** has not been completed. However, a high-level review indicates that the field sampling and handling procedures produced quality assurance / quality control (QA/QC) results that demonstrate that the soil vapour and soil data are of an acceptable quality and suitable for use in site characterisation.

The NATA certified laboratory results indicate that the project laboratory was generally achieving levels of performance within its recommended control limits during the period when the samples from this program were analysed.

On the basis of the results of the field and laboratory QA/QC program, the soil vapour and soil data are considered to be of an acceptable quality in order to achieve the objectives of the assessment.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8. Vapour Assessment

8.1 Field Observations

Sub-slab and soil vapour probes were installed across 18 sample locations at accessible areas within AEC1 at the site. Borelogs are provided for the soil vapour probes in **Appendix B**. No significant odours or indicators of contamination were observed during placement of the boreholes for the sample locations.

Stabilised oxygen, PID, methane, carbon dioxide and hydrogen sulphide readings were obtained at each sample location prior to collection of the vapour sample. The measured levels are summarised in **Table 8.1**.

Table 8.1: Summary of Field Measured Vapours / Gases at Sub-slab and Soil Vapour Probes

Sample ID	O_2 (%)	PID (ppm)	Carbon Dioxide (%)	Methane (%)	Hydrogen Sulphide (ppm)
Sub-Slab Probes

8.2 Summary of Results

Soil vapour analysis results are summarised in **Appendix A**. Sample locations as undertaken during this assessment are shown on **Figure 5**.

8.2.1 Sub-slab Vapour

Consistent with previous investigations, constituents as measured in soil vapour have been generally restricted to chlorinated hydrocarbons with some minor detections of BTEX compounds. As established in the RAP (2019a), the most significant of the detected constituents with respect to the health risk and proposed future remediation and validation of the site is TCE and PCE.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Elevated levels of TCE and PCE were reported in sub-slab vapour at all locations underlying Shop 3 Gaymark Lane (as represented by SS01 to SS09). In addition, elevated levels of TCE and PCE were reported at historical sub-slab vapour sample locations SV10 and SV14 as collected by JBS&G in previous sampling events. Conversely, the levels of TCE and PCE within samples at SV12 to SV18 were below laboratory detection limits, providing evidence that CE impacts have not migrated to this lateral extent.

8.2.2 Soil Vapour

To inform the likely required remedial excavation depth, JBS&G installed soil vapour probes at depths of 1 m and 4 m at locations SV10 and SV11. At both locations, elevated levels of TCE and PCE were detected in the shallow probe (1 m) but below detection limits in the deeper probes (4 m). This data provides evidence that the low permeability clay soils at the site have retarded the vertical migration of these impacts at the site. This is concordant with the visually observed depth of more permeable fill material overlying residual clays.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9. Soil Assessment

The lithology encountered at the site during the field works is summarised below. Borehole logs are included in **Appendix B**.

9.1 Field Observations

The soil investigation works comprised a total of two boreholes advanced via push tube within the locations of the two soil vapour probes installed as part of the assessment. Fill material was encountered beneath the existing pavements at both locations to depths of 0.4-0.5 m bgs.

The fill material comprised of brown silty clay of moderate plasticity with inclusions of ash. The fill was underlain by natural grey and brown silty clay of high plasticity to the maximum depth of the investigation (4.2 m bgs). There was no significant evidence of odours/staining observed within the soil/fill profile during the field works. In addition, the PID readings ranged from 1.3-3.1 ppm throughout the soil profile from which the primary source of CE impacts within the fill profile could not be inferred based on the measurements. No visible asbestos containing material was identified during the soil assessment activities.

9.2 Analytical Results

Laboratory analysis results for soil samples completed for the investigation have been summarised in tables presented in **Appendix A**, with comments discussed in the sections below.

9.2.1 Total VOCs

The total concentration of all VOCs in each sample selected for analysis were below the laboratory limit of reporting (LOR) with the exception of PCE within SV11 0.2-0.3 (2.2 mg/kg). Consistent with the soil vapour data discussed in **Section 8**, the CE impacts at AEC1 appear to be confined to shallow soils and fill based materials.

9.2.2 Leachability of VOCs

The leachable concentration (via ASLP) of all VOCs in each sample selected for analysis (including SV11 0.2-0.3) were below the laboratory LOR, indicating the CE impacts at AEC1 appear to be largely non-leachable at the locations assessed.

9.2.3 Preliminary Waste Classification

Comparison of the total contaminant concentrations with the NSW EPA (2014) assessment criteria is presented in **Table A**. In summary, the results were all below the CT1 and/or SCC1 thresholds presented in NSW EPA (2014) for waste classification without toxicity characteristic leaching procedure (TCLP) analysis for all compounds with the exception of benzo(a)pyrene (B(a)P) that within SV10 0.1-0.2 (2.5 mg/kg).

SV10 0.1-0.2 was subsequently scheduled for TCLP B(a)P analysis to inform a preliminary waste classification of materials on-site. The results are presented in **Table B2,** in which the leachable concentration of B(a)P was below the TCLP1 values presented in EPA (2014).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

10. Site Characterisation

Based on the decision-making process for assessing urban redevelopment sites detailed in in EPA (2017)[16] and discussed in **Section 5.1.5**, the decisions required to be made in order to satisfy the objectives of the assessment are discussed below.

10.1 Have the identified site-related contaminants (chlorinated ethenes) acting as potential source material been appropriately and sufficiently delineated?

JBS&G (2020) presented a detailed sampling plan to refine the required remedial extent within AEC1, however due to tenants currently occupying commercial spaces within the area access has been restricted to the locations shown on **Figure 5**.

Elevated levels of PCE and TCE were reported in sub-slab vapour at all locations underlying Shop 3 Gaymark Lane (as represented by SS01 to SS09). In addition, elevated levels of TCE and PCE were reported at historical sub-slab vapour sample locations SV10 and SV14 as collected by JBS&G in previous sampling events. Conversely, the levels of TCE and PCE within samples at SV12 to SV18 were below laboratory detection limits, providing evidence that soil vapour has not migrated to this lateral extent. On this basis, the inferred lateral extent of CE impacted soils acting as potential source material (to soil vapour) is shown on **Figure 5** – equating to an area of approximately 650 m^2. It is noted that the lateral source material extent has been conservatively included to comprise of the area around SV18 and extending west towards SV12-SV17 and east towards Gaymark Lane, where limited data has been collected.

To inform the likely depth of CE source material, JBS&G installed soil vapour probes at depths of 1 m and 4 m at locations SV10 and SV11. At both locations, elevated levels of TCE and PCE were detected in the shallow probe (1 m) but below detection limits in the deeper probes (4 m). This data provides evidence that the low permeability clay soils at the site have retarded the vertical migration of these impacts at the site. This is concordant with the visually observed depth of more permeable fill material overlying residual clays and the detection of PCE within the shallow soil sample SV11 0.2-0.3 (2.2 mg/kg) that was in turn, reported at below detection limits in all underlying soil samples.

Noting the limitations in the way of access, additional assessment is proposed prior to completing the remediation works to further delineate the lateral and vertical extent of source material within AEC1. It is noted too that the location where CE impacts have historically migrated from the shallow soils to underlying groundwater (that is approximately 7 m bgs) has not been determined. Based on the potential that the former site operator may have disposed of dry-cleaning fluids either down the sewer or stormwater drains, the greatest impacts are expected within the trenches of these underground utilities that extend from the property. On this basis, the additional assessment works will be required to target these potential preferential pathways such that all source material at AEC1 can be identified and the final remedial extent can be defined.

10.2 Can a preliminary waste classification be provided for materials that may require off-site disposal during remediation activities?

Based on the total contaminant concentrations within samples collected from in-situ materials assessed herein and comparison to NSW EPA (2014) assessment criteria identified that the fill based soils at the site are largely consistent with a preliminary waste classification of General Solid Waste (GSW).

It is noted that within SV10 0.1-0.2, the B(a)P concentration exceeded the CT1 and/or SCC1 thresholds presented in NSW EPA (2014) for waste classification without TCLP analysis. Additional TCLP B(a)P analysis of this sample identified that the leachable concentration of B(a)P were below

[16] Contaminated Land Management, Guidelines for the NSW Site Auditor Scheme (3rd edition), NSW EPA, October 2017 (EPA 2017(.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

the TCLP1 values presented in EPA (2014). Consistent with the observation of ash within the fill materials assessed herein, the preliminary TCLP data suggests that the PAHs are largely non-leachable and likely immobilised within the ash matrix in fill. As such, it is anticipated that the General Approvals of the Immobilisation of Contaminants in Waste (EPA 1999/05) will in the future be applied in conjunction with additional laboratory data to confirm an appropriate waste classification for off-site disposal of excess excavated material

10.3 Are there any impacts of chemical mixtures?

There were no potential chemical mixtures identified during the investigation that may pose a management issue at the site.

10.4 Is further assessment required (i.e. is there enough information to prepare a detailed RWP for the development area)?

As noted in **Section 10.1**, further assessment is required to refine the lateral and vertical extent of source material that will require remediation within AEC 1. In addition, further assessment of potential impacts associated with AEC 3 and AEC 4 will be required following demolition of existing structures as detailed in **Section 4**.

Notwithstanding, the preliminary data presented herein has refined the lateral extent of CE impacted soils that will require remediation to an approximate area of 650 m^2. In addition, the depth of CE impacted soils acting as source material appears confined to shallow soils based on the results of the soil vapour analysis (1 and 4 m soil vapour probes) as well as total contaminant concentrations within soil samples analysed. Further, based on the ASLP data from selected soil analysis, the CE impacts within soils appear to be non-leachable (at the locations assessed) and therefore not likely to present an on-going source to groundwater impacts. As such, with the additional data collected herein, there is considered to be sufficient information to prepare a draft RWP with the preferred remedial approach as specific to the proposed development scheme (**Appendix C**).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

11. Conclusions

Based on the data presented herein and subject to the limitations presented in **Section 12**, the following conclusions are made:

- Consistent with historical investigations, elevated levels of tetrachloroethylene (PCE) and trichloroethylene (TCE) were reported in sub-slab vapour at sample locations underlying Shop 3 Gaymark Lane (as represented by SS01 to SS09). Conversely, the levels of TCE and PCE within samples at locations within the western portion of AEC1 (SV12 to SV18) were below laboratory detection limits, providing evidence that soil vapour has not migrated to this lateral extent. On this basis, the inferred lateral extent of CE impacted soils acting as potential source material (to soil vapour) and requiring remediation has been refined to an area of approximately 650 m^2 as shown on **Figure 5**. Additional assessment, as outlined herein will likely further refine this inferred lateral remediation extent.
- To inform the likely depth of CE source material, JBS&G installed soil vapour probes at depths of 1 m and 4 m at locations SV10 and SV11. At both locations, elevated levels of TCE and PCE were detected in the shallow probe (1 m) but below detection limits in the deeper probes (4 m). This data provides evidence that the low permeability clay soils at the site have retarded the vertical migration of these impacts at the site. This is concordant with the visually observed depth of more permeable fill material overlying residual clays and the detection of PCE within the shallow soil sample SV11 0.2-0.3 (2.2 mg/kg) that was in turn, reported at below detection limits in all underlying soil samples. Additional assessment, as outlined herein will likely further refine this inferred vertical remediation extent.
- The leachable concentration (via Australian Standard Leaching Procedure, ASLP) of all VOCs in each soil sample selected for analysis (including SV11 0.2-0.3) were below the laboratory LOR, indicating the CE impacts at AEC1 appear to be largely non-leachable at the locations assessed and therefore unlikely to present an on-going risk to groundwater.
- Based on the total contaminant concentrations and leachable concentrations (via toxicity characteristic leaching procedure, TCLP) within samples collected from in-situ materials assessed herein and comparison to NSW EPA (2014) assessment criteria identified that the fill based soils at the site are largely consistent with a preliminary waste classification of General Solid Waste (GSW).
- Additional assessment is required to further refine the lateral and vertical extent of source materials within AEC1 that will require remediation. In addition, the additional investigations will require to assess the extent of CE impacts within underground service trenches within AEC1, where the former site operator potentially disposed of dry-cleaning fluids that historically caused environmental impacts (potentially to depth). The additional investigations are proposed to be completed when the commercial tenants (within the area of AEC1) vacate the properties prior to remediation works.

12. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquiries.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

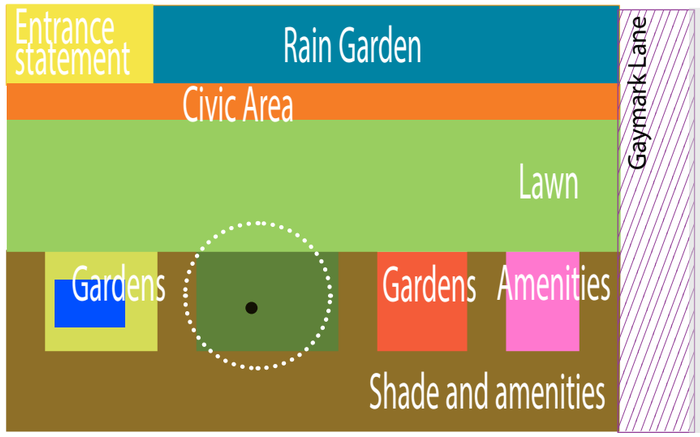
Henry St

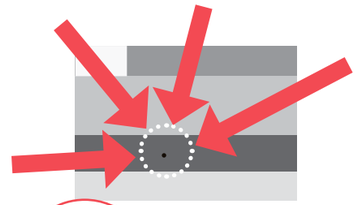
Station St



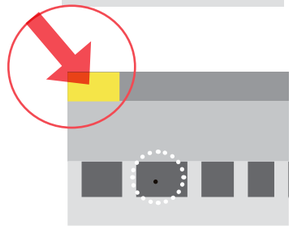
Allen Place

High St

Key principles

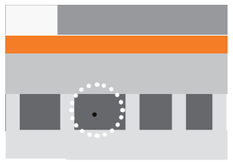


Celebrate the tree



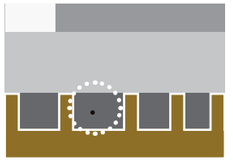
Open the corner to Station Street, allow clear views in and integrate landmark

Use rain garden to define the Northern edge and protect from street



Civic area on the Northern Edge that is protected from Henry Street

Maximise the scale by emphasizing length



Provide shade and amenities screening southern edge

Gardens and trees as a place of respite for more intimate experience include water

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5 Aims - Create a City Park with

- **A strong identity**
  create a vibrant city Centre and celebrate the local landscape

- **A variety of use opportunities**
  flexibility for events and passive activation

- **A variety of spaces**
  respond to the aspirations & needs of a diverse community throughout the seasons

- **Environmental benefits**
  mitigate heat island effect, permeable, incorporate WSUD and native vegetation

- **Social benefits**
  the park as a meeting point, building the community

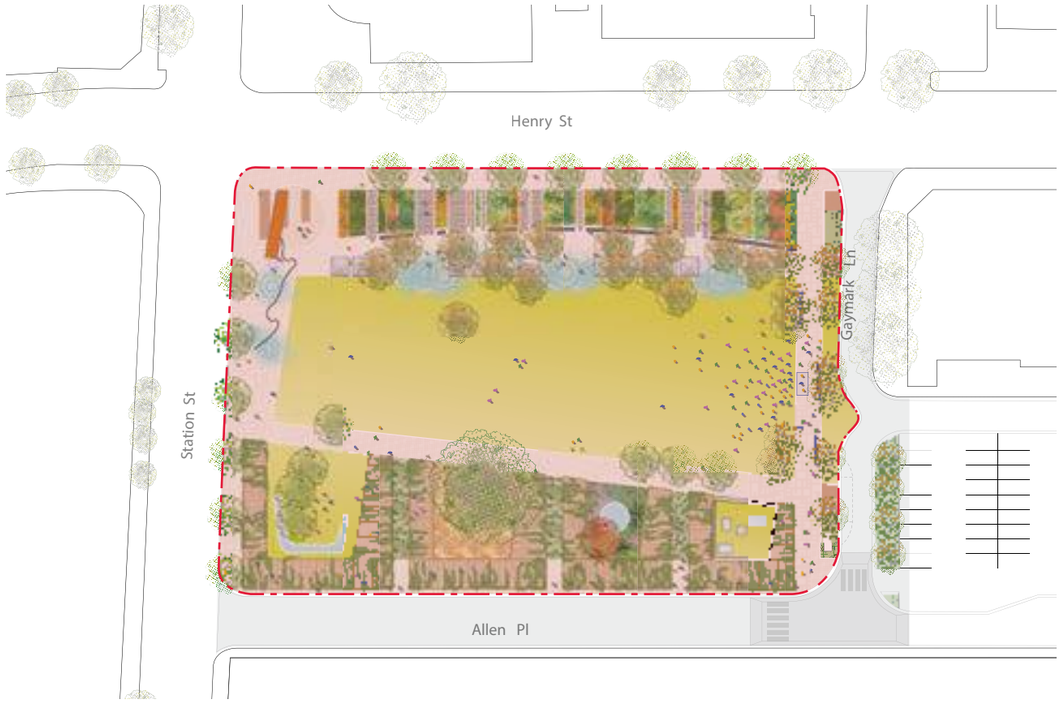
- EOW - City Park: items 1-24
- EOW - Road Works item 25



1:1000 @ A3

0 10 20 40m

City Park

Item	Description	Total
01	Demolition of existing buildings incl. removal of hazardous materials - by separate works package (excluded)	excluded
02	Demolition - carpark & hardstands	$202,255
03	Site Preparation	$27,554
04	Existing Services	$54,724
05	Ground Contamination	$100,000
06	Earthworks	$10,682
07	Civil Stormwater	$375,000
08	Raingarden	$200,640
09	Concrete Seating	$119,743
10	Pavements & Surface Finishes	$816,102
11	Fixtures & Furniture	$157,800
12	Water Fog/Misting & Water Features	$900,000
13	Amenities Building	$888,750
14	Shade structure (Pergola)	$622,797
15	Vertical Marker/Entrance Statement	$450,000
16	Public Art & Signage	$150,000
17	Landscaping (including irrigation)	$361,909
18	Landscape Establishment Maintenance (12 months)	$81,600
19	Water, Gas, & Sewer Services	$58,900
20	Water Harvest & Re-Use	$545,000
21	Electrical Services (incl. lighting & power, substation, CCTV, Wi-Fi)	$1,012,000
22	Contractors Preliminaries, Overheads & Margin	$998,964
23	Contingency - design & price risk (15%)	$1,012,000
24	Total: Construction Cost (excl. GST)	$9,354,483

Road Works

Item	Description	Total
25	Separate option - Extend Gaymark Lane to Allen Place, widen Allen Place to two lanes, pedestrian crossings, associated stormwater	$641,342

Appendix D Field Calibration Sheets

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Field Equipment Calibration and Decontamination

PROJECT NAME: PENRITH PARK	**PROJECT NO:** 58140
FIELDWORK DATES: 18/5/20	**SAMPLERS:** MN CB
TYPE OF INVESTIGATION: SUB-SLAB SURVEY	**PROJECT MANAGER:** CB

CALIBRATION SUMMARY

EQUIPMENT: PID	
CALIBRATION STANDARD: 100 ppm Isobutylene	

DATE	TIME	READING (ppm)	COMMENTS
18/5/20	11:00	0	Zero Cal
-	11:01	100 ppm	- bump test completed after 100 ppm calibration and reading was 100ppm.

DECONTAMINATION SUMMARY

EQUIPMENT: N/A – New disposable tubing used for each probe.

1	Was the equipment decontaminated appropriately prior to sampling at each location?	Y	N	NA
2	Was excess soil removed by scraping, brushing or wiping with disposable towels?	Y	N	NA
3	Was the equipment contaminated with grease, tar or similar material?	Y	N	NA
	If so, was the equipment steam cleaned or rinsed with pesticide-grade acetone:hexane?	Y	N	NA
4	Was phosphate-free detergent used to wash the equipment?	Y	N	NA
5	Was the equipment rinsed with clean water?	Y	N	NA
6	Was the equipment then rinsed with deionised water?	Y	N	NA
7	Were all sample containers cleaned and acid or solvent washed prior to sample collection?	Y	N	NA

WERE ANY ADDITIONAL DECONTAMINATION MEASURES REQUIRED? PROVIDE DETAILS

Field Equipment Calibration and Decontamination

PROJECT NAME: Penrith	**PROJECT NO:** ~~S~~ 58140
FIELDWORK DATES: 29/5/20	**SAMPLERS:** MW
TYPE OF INVESTIGATION: Soil vapour / Soil sampling	**PROJECT MANAGER:** CB

CALIBRATION SUMMARY

EQUIPMENT: PID
CALIBRATION STANDARD: 100 ppm isobutylene

DATE	TIME	READING (ppm)	COMMENTS
29/5/20	8:00	0	Zero calibration
↓	8:01	100.4	100.0 ppm isobutylene calibration
	8:02	100.1	bump test
30/5/20	9:10	0	Zero calibration
	9:11	100.4	100 ppm isobutylene
	9:12	100.2	bump test

DECONTAMINATION SUMMARY

EQUIPMENT: ~~new pair of nitrile g~~				
1	Was the equipment decontaminated appropriately prior to sampling at each location?	Y	N	NA
2	Was excess soil removed by scraping, brushing or wiping with disposable towels?	Y	N	NA
3	Was the equipment contaminated with grease, tar or similar material?	Y	N	NA
	If so, was the equipment steam cleaned or rinsed with pesticide-grade acetone:hexane?	Y	N	NA
4	Was phosphate-free detergent used to wash the equipment?	Y	N	NA
5	Was the equipment rinsed with clean water?	Y	N	NA
6	Was the equipment then rinsed with deionised water?	Y	N	NA
7	Were all sample containers cleaned and acid or solvent washed prior to sample collection?	Y	N	NA
WERE ANY ADDITIONAL DECONTAMINATION MEASURES REQUIRED? PROVIDE DETAILS				
new pair of nitrile gloves for every sample collected. new tubing used for soil vapours

Calibration Certificate # 5096

Manufacture/Model	: Gas Data GFM435
S/N	: 12022
Gases Monitored	: CH4, 0-100%, CO2 0-100%, O2 0-25%, H2S & CO
Zero setting CH4/CO2/O2/H2S/CO	: 0.0
Gas used	: N2
Cylinder No.	: BOC High Purity
Span setting CH4	: 60.0%
Gas used	: 60.0% CH4 in CO2
Cylinder No.	: Air Liquide 72927 (NATA)
60.0% CH4 in CO2 reads	: 59.9%
5.1% CH4 in CO2 reads	: 4.8%
Span setting CO2	: 40.0%
Gas used	: 40.0% CO2 in CH4
Cylinder No.	: Air Liquide 72927 (NATA)
40.0% CO2 in CH4 reads	: 40.1%
5.2% CO2 in CH4	: 4.9%
Span setting O2	: 20.9% (Air) Reads 20.9%
Span setting 25ppm H2S reads	: 25ppm
Span setting 1100ppm CO reads	: 1122ppm
Hexane	: Factory setting
Cells replaced	: Oxygen
Estimated Date of cell replacement	: Oxygen 11/5/22
Comments	: Calibration OK
Flow rate	: 550ml/min. OK
Atm. Pressure 1008mb	: 1010mb
Next Service/calibration Due	: 11/5/21

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Isopropanol	Melbourne	May 18, 2020	14 Days
- Method: LTM-ORG-2030 VOCs in Ambient Air by GC/MS			
VOCs in Ambient Air by GC/MS	Melbourne	May 18, 2020	14 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Sample Receipt Advice

Company name:	**JBS & G Australia (NSW) P/L**
Contact name:	Chris Bielby
Project name:	PENRITH PARK
Project ID:	58140
COC number:	Not provided
Turn around time:	5 Day
Date/Time received:	May 18, 2020 5:08 PM
Eurofins reference:	**720161**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☒ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Ursula Long on Phone : or by e.mail: UrsulaLong@eurofins.com

Results will be delivered electronically via e.mail to Chris Bielby - cbielby@jbsg.com.au.

EUROFINS.

CERTIFICATE OF ANALYSIS 243115

Client Details

Client	JBS & G (NSW & WA) Pty Ltd
Attention	Chris Bielby
Address	Level 1, 50 Margaret St, Sydney, NSW, 2000

Sample Details

Your Reference	**58140, Penrith Park**
Number of Samples	1 carbon tube
Date samples received	18/05/2020
Date completed instructions received	18/05/2020

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	25/05/2020
Date of Issue	22/05/2020

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Josh Williams, Senior Chemist

Authorised By

Date Sampled		18/05/2020
Type of sample		carbon tube
Surrogate Toluene-d8	%	92
Surrogate 4-Bromofluorobenzene	%	86

Method ID	Methodology Summary
ORG-022	Determination of volatile organic compounds in charcoal tubes/badges/sorbents using CS2 extraction, based on NIOSH methods using GC/GC-MS. Desorption efficiencies are not applied to results in ug/tube. Note where µg/m^3 results are supplied for SKC badges, the factors used are for 575-001, if 575-001 data is unavailable for an analyte then use 575-002 then 575-003 (exposure time must be supplied).

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Isopropanol	Melbourne	Jun 01, 2020	14 Days
- Method: LTM-ORG-2030 VOCs in Ambient Air by GC/MS			
VOCs in Ambient Air by GC/MS	Melbourne	Jun 01, 2020	14 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Sample Receipt Advice

Company name:	**JBS & G Australia (NSW) P/L**
Contact name:	Chris Bielby
Project name:	PENRITH SOIL VAPOUR
Project ID:	58140
COC number:	Not provided
Turn around time:	2 Day
Date/Time received:	Jun 1, 2020 4:58 PM
Eurofins reference:	**722975**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Ursula Long on Phone : or by e.mail: UrsulaLong@eurofins.com

Results will be delivered electronically via e.mail to Chris Bielby - cbielby@jbsg.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Volatile Organics	Sydney	Jun 01, 2020	7 Days

- Method: LTM-ORG-2150 VOCs in Soils Liquid and other Aqueous Matrices

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Attention:	Chris Bielby
Report	723042-AID
Project Name	PENRITH SOIL
Project ID	58140
Received Date	Jun 01, 2020
Date Reported	Jun 04, 2020

Methodology:

Asbestos Fibre Identification	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. *NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.*
Unknown Mineral Fibres	Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as Electron Microscopy, to confirm unequivocal identity. *NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an independent technique.*
Subsampling Soil Samples	The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed. *NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.*
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination.The resultant material is then further examined in accordance with AS 4964 - 2004. *NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.*
Limit of Reporting	The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). *NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos".This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH.*

Version: 1, Version Date: 14/04/2021

Project Name PENRITH SOIL
Project ID 58140
Date Sampled May 29, 2020
Report 723042-AID

Client Sample ID	Eurofins Sample No.	Date Sampled	Sample Description	Result
SV10 0.1-0.2	20-Jn02053	May 29, 2020	Approximate Sample 469g Sample consisted of: Brown coarse-grained clayey soil and rocks	No asbestos detected at the reporting limit of 0.001% w/w.* Organic fibre detected. No trace asbestos detected.
SV11 0.2-0.3	20-Jn02059	May 29, 2020	Approximate Sample 510g Sample consisted of: Brown coarse-grained clayey soil, cement fragments and rocks	No asbestos detected at the reporting limit of 0.001% w/w.* Organic fibre detected. No trace asbestos detected.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Samples were analysed on an 'as received' basis.
4. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
5. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

Units

% w/w: weight for weight basis	grams per kilogram
Filter loading:	fibres/100 graticule areas
Reported Concentration:	fibres/mL
Flowrate:	L/min

Terms

Dry	Sample is dried by heating prior to analysis
LOR	Limit of Reporting
COC	Chain of Custody
SRA	Sample Receipt Advice
ISO	International Standards Organisation
AS	Australian Standards
WA DOH	Reference document for the NEPM. Government of Western Australia, Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia (2009), including supporting document Recommended Procedures for Laboratory Analysis of Asbestos in Soil (2011)
NEPM	National Environment Protection (Assessment of Site Contamination) Measure, 2013 (as amended)
ACM	Asbestos Containing Materials. Asbestos contained within a non-asbestos matrix, typically presented in bonded and/or sound condition. For the purposes of the NEPM, ACM is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
AF	Asbestos Fines. Asbestos containing materials, including friable, weathered and bonded materials, able to pass a 7mm x 7mm sieve. Considered under the NEPM as equivalent to “non-bonded / friable”.
FA	Fibrous Asbestos. Asbestos containing materials in a friable and/or severely weathered condition. For the purposes of the NEPM, FA is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
Friable	Asbestos-containing materials of any size that may be broken or crumbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is outside of the laboratory’s remit to assess degree of friability.
Trace Analysis	Analytical procedure used to detect the presence of respirable fibres in the matrix.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Comments

S20-Jn02053: Sample received was less than the nominal 500mL as recommended in Section 4.10 of the NEPM Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N/A	Not applicable

Sample Receipt Advice

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Chris Bielby
Project name: PENRITH SOIL
Project ID: 58140
COC number: Not provided
Turn around time: 2 Day
Date/Time received: Jun 1, 2020 4:48 PM
Eurofins reference: **723042**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins Sample Receipt : 14.2 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Ursula Long on Phone : or by e.mail: UrsulaLong@eurofins.com

Results will be delivered electronically via e.mail to Chris Bielby - cbielby@jbsg.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Polycyclic Aromatic Hydrocarbons	Sydney	Jun 10, 2020	7 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Sydney	Jun 11, 2020	180 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
USA Leaching Procedure	Sydney	Jun 10, 2020	14 Days
- Method: LTM-GEN-7010 Leaching Procedure for Soils & Solid Wastes

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Company name: **JBS & G Australia (NSW) P/L**

Contact name: Chris Bielby
Project name: ADDITIONAL PENRITH SOIL
Project ID: 58140
COC number: Not provided
Turn around time: 1 Day
Date/Time received: Jun 10, 2020 6:10 PM
Eurofins reference: **724725**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins Sample Receipt : 14.2 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Ursula Long on Phone : or by e.mail: UrsulaLong@eurofins.com

Results will be delivered electronically via e.mail to Chris Bielby - cbielby@jbsg.com.au.

1. Introduction

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (the client) to prepare a Construction Environmental Management Plan (CEMP) for the proposed demolition and remediation works to be undertaken with the western portion of the proposed Penrith Central Village Park (City Park). The site location and boundary are presented in **Figure**. The site is legally identified as Lot 1 in DP 164798 and Lot 1 in DP 252457 (134 to 138 Henry Street), Lot 10 and 11 in DP 553665 (140 to 142 Henry Street), Lot 2 in DP 556075 (144 Henry Street), Lot 3 in DP1200790 (42 to 44 Station Street), Lot 1 in DP 526304 (48 to 50 Station Street) and Lot E in DP 163176 (46 Station Street). Notwithstanding the descriptions, portions of the site are also referred to as being present with the former Allen Place Car Park. The site extent if shown as **Figure 2**.

The proposed development will comprise the construction of the Penrith Central Village Park (City Park) which is a large open space / recreational area to be established in the centre of the Penrith central business district. Of note to this plan, demolition works of a range of existing structures will be required prior to site remediation. Areas of soils on the site are further impacted by asbestos and chlorinated ethenes. The extent of chlorinated ethene impacted soils are shown on **Figure 3**. The extent of asbestos impacted soils will be determined following site demolition / pavement removal works. These impacted soils are proposed to be remediated prior to the construction of the Park by excavation, consolidation and encapsulation on-site for long term management. The proposed design of the Park is shown as **Figure 4**, and the area of proposed containment is shown on **Figure 5**.

A pre-Development Application meeting has been held with PCC which amongst a range of documents has identified a requirement for preparation of an Erosion and Sediment Control Plan and a Waste Management Plan. The required elements of these plans, as specific to demolition, remediation and associated construction works, have been incorporated into a CEMP as presented here.

This CEMP has been prepared in response to the pre-DA requirements and in accordance with relevant guidelines made or approved by the NSW EPA.

1.1 Background

The City Park is described as being a significant open space in a prime location on the corner of Henry Street and Station Streets, Penrith. City Park will be a vibrant, thriving, green space with something for everyone and plenty of opportunities to meet, retreat, eat, be active and celebrate together. These aspects are expected to strengthen its appeal as a destination for residents, workers, and visitors and stimulate the day and night time economy.

Key features of the City Park design include a variety of large trees to provide shade, a sensory garden, several water features, as well as natural landscaping to transform the space into an urban retreat. The concept design also provides space for people to meet, eat, be active and celebrate together with these aspects set to stimulate the day and night time economy by attracting residents, visitors and investors.

JBS&G has previously undertaken environmental assessments across the extent of the proposed City Park site for the purposes of determining whether historical commercial, industrial and retail uses had caused environmental impacts to soils and groundwater underlying the site. This has included a significant program of soil, groundwater, soil vapour and indoor air sampling and analysis. The findings of these environmental assessments substantially affect the potential for environmental emissions from the proposed site remediation and associated site construction works and are discussed further following.

Asbestos impacted fill-based soils have previously been identified on the City Park site and are potentially widespread and heterogeneously distributed between the sample locations to date where they have been identified.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Chlorinated ethene (CE) impacted soils have been identified underlying 134-138 and 140 Henry Street (**Figure 3**). The occurrence of these contaminants is associated with historical dry cleaning activities as undertaken at 134-138 Henry St. There is a potential of uncontrolled disposal of dry cleaning fluids (which consist of tetrachloroethene) by the former site operator. Tetrachloroethene degrades within the environment to form other chlorinated ethenes including trichloroethene, cis-1,2-dichloroethene and vinvl chloride. Uncontrolled disposal is noted as likely to have included disposal of dry-cleaning fluids either down the sewer or stormwater drains, indicating that chlorinated ethene contaminated soils are more likely in proximity of site services / historical service easements / corridors.

To comply with relevant waste minimisation and ecological sustainable development objectives the contaminated soils will be remediated by on-site encapsulation and long-term management (**Figure 5**). The implementation of these remedial methods will comprise significant storage and handling of contaminated soils which requires to be specifically addressed by the CEMP.

2. Objectives and Scope of CEMP

To achieve the objectives outlined in **Section 2.1**, this CEMP will include a description of works, relevant and applicable legislation and regulatory requirements, description of potential impacts of the project and associated management measures.

2.1 Objectives

The objectives of this document are to control potential environmental emissions, from the demolition, remediation and construction works controlled on the site. As per the request from the pre-DA meeting this is required to specifically include consideration of sediment, erosion and waste management.

A description of the environmental management requirements as identified for the project and applicable regulatory guidance are provided in **Sections** Error! Reference source not found. to **2.4** following.

2.1.1 Environmental Aspect Checklist

Table 2.1: Description of Aspects addressed in this CEMP

Aspect	Location in CEMP
Description of works	**Section 4**: Description of works
Details of all contractors involved with the project	**Section 5**: CEMP Responsibilities
Environmental awareness and training of contractors	**Section 5.3**: Competence, Training and Awareness
Compliance with legislation and regulations	**Section 2.3**: Legislative Framework
Measures to prevent noise, water, air and land pollution	**Section 6.4**: Management Measures of Potential Impacts
Safe access to and from the site during construction	**Section 0**: CEMP reference: **12**
Safety and security of work site, road and footpath area	**Section 0**: CEMP reference: **12**
Method of loading and unloading excavation machines, construction materials	**Section 0**: CEMP reference: **12**
Details of management of construction materials and wastes.	**Section 0**: CEMP reference: **10**
Construction vehicle access and egress	**Section0**: CEMP reference: **10**
Erosion and sediment control measures	**Section 6.4.1**: CEMP reference: **1, 3** and **5**
Details of any fuel storage and management	**Section 6.4.1**: CEMP reference: **4**
Detailed erosion and sediment control measures	**Section 6.4.1**: CEMP reference: **3**
Protection of existing trees and vegetation	**Section 6.4.3**: CEMP reference: **8**
Unexpected Finds Protocol	**Appendix A B**
Work, Health & Safety requirements	**Section 0**: CEMP reference: **11, 12, 13, 14** and **15.**
Contingency and emergency response plans	**Section 5.4**: Contingency and Emergency Response Plans

2.2 Referenced Reports

The following studies have been referenced within this CEMP:

- *Penrith City Council Penrith Central Park Village Overarching Remedial Action Plan 114 to 146 Henry Street, 42 to 50 Station Street and Allen Place Car Park rev 0*, 5 March 2019, JBS&G Australia Pty Ltd (JBS&G 2019);
- *Penrith City Council Penrith Central Park Village DRAFT Pre-Remediation Investigation 134 to 144 Henry Street, 42 to 50 Station Street, and Allen Place Car Park rev A*, 17 September 2020, JBS&G Australia Pty Ltd (JBS&G 2020a);
- *Penrith City Council Penrith Central Park Village DRAFT Remedial Work Plan 134 to 144 Henry Street, 42 to 50 Station Street, and Allen Place Car Park rev B*, 8 December 2020, JBS&G Australia Pty Ltd (JBS&G 2020b); and
- *Penrith City Council DRAFT Long Term Environmental Management Plan Penrith Central Village Park 134-144 Henry St, 42-50 Station St and Allen Place Car Park PENRITH, NSW rev A*, 4 December 2020, JBS&G Australia Pty Ltd (JBS&G 2020c).

2.3 Legislative Framework

The key relevant acts, regulations and guidelines are listed below with a summary of their applicability. The site owner and contractors are required to satisfy themselves that all applicable permits and licences have been obtained and their conditions satisfied.

Work Health and Safety Act 2011 (WHS Act 2011)

- The overarching Act for NSW setting law relating to employee health and safety and employer responsibilities.

Work Health and Safety Regulation, 2017 (WHS Regulation, 2017)

- Sets Regulations and details the duties for employers to achieve required employee health and safety performance with reference to the management and working with asbestos. The WHS Regulation 2017 also contains requirements for maintenance of asbestos registers.

Protection of the Environment Operations Act 1997 (POEO Act 1997)

- The POEO Act enables the Government to set out explicit protection of the environment policies (PEPs) and adopt more innovative approaches to reducing pollution. Includes regulation of waste activities including appropriate assessment, classification and disposal of waste including waste soil.

***Contaminated Land Management Act 1997* (CLM Act 1997)**

- The CLM Act controls the assessment of contamination and management of contaminated soils and groundwater. The Act also provides guidance for the determination of whether a site is considered significantly contaminated land, and allows for accreditation of Site Auditors.

Environmental Planning and Assessment Act 1979 (EP&A Act 1979)

- The EP&A Act allows plans to be made (environmental planning) to guide the process of development including development on potentially contaminated land. Linked to State Environmental Planning Policy (SEPP) 55 'Remediation of Land' relating to making planning decisions regarding contaminated and potentially contaminated land.

State Environmental Planning Policy (SEPP) 55 'Remediation of Land'

- SEPP 55 relates to the decision-making process in undertaking remediation of land and making planning decisions regarding contaminated and potentially contaminated land.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Waste Avoidance and Resource Recovery Act 2001 (WARR Act)

- The WARR Act replaced the Waste Minimisation and Management Act 1995 and controls waste generation and reduction.

Penrith Development Control Plan 2014

- The Penrith Development Control Plan (PDCP, 2014) provides objectives and development controls that establish clear guidelines for development and protection of the environment which include:
    a. Protection of vegetation within riparian corridors;
    b. Protection of vegetation in developable areas;
    c. Water cycle management; and
    d. Contamination.

Penrith Local Environmental Plan 2010

- The proposed development at the site is identified to be under the Penrith Local Environmental Plan (PLEP, 2010) and must meet all requirements described within.

2.4 Scope

In order to achieve the objectives stated in **Section 2.1** above, the preparation of the CEMP involved the following tasks:

- Review of the project outline as per PCC media releases and concept plans as well as a review of the environmental setting against proposed land use, including consideration of the regional hydrology, hydrogeology, geology, climate and soils;
- Review of available reports relating to contamination assessment, remediation and validation, including the JBS&G (2019, 2020a, 2020b and 2020c) reports;
- Review the NSW DPI (2004*). Guidelines for the Preparation for Environmental Management Plans* as well as other site-specific management plans;
- Review of and surrounding land uses based on satellite images and other online resources;
- Review of the Client's concept plan and likely extent of facilitating works (**Figure 4**); and
- Development of mitigation measures based on current site environmental conditions current development scope, compliance obligations and effectiveness in controlling potential unexpected contamination finds.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Site Description

3.1 Site Details

Detailed information of the site condition, physical characteristics, history and surrounding land uses provided in the following sections are summarised from previous site reports. A list of site reference reports is provided in **Section 0.**

The site is located between Henry and Station Sts in Penrith, further incorporating the Allen Place Car Park. The site location is shown on **Figure 1** and the site extent is shown on **Figure 2**. Site details are summarised in **Table 3.1** below.

Table 3.1: Summary Site Details

Property Identification and Street Addresses	The site is comprised of the following legal properties: • Lot 1 in DP 164798 and Lot 1 in DP 252457 – 134 to 138 Henry Street • Lot 10 and 11 in DP 553665 – 140 to 142 Henry Street • Lot 2 in DP 556075 – 144 Henry Street • Lot 3 in DP1200790 – 42 to 44 Station Street • Lot 1 in DP 526304 – 48 to 50 Station Street • Lot E in DP 163176 – 46 Station Street In addition, the site area includes portions of the Allen Place Car Park.
Local Government Authority	Penrith City Council
Approximate MGA Coordinates (MGA 56)	Easting: 286582.2 Northing: 6262912.7
Site Zoning	Commercial Core (B3) and Public Recreation (RE1) under Penrith Local Environmental Plan (LEP) 2010
Current Use	Commercial (car parking, retail and services)
Previous Use	Commercial/industrial (car parking, dry cleaning and general retail/services) and residential
Proposed Use	Public open space
Site Area	Approximately 0.71 ha

3.2 Surrounding Land Use

The land uses of adjacent properties or properties across adjacent roads at the time of inspection are summarised below.

- North – The site is bound to the north by Henry Street and then numerous commercial premises including UFC Gym, Queens of Hearts Community Foundation and Nepean College. Further north is an open carpark and commercial premises on Belmore Street, including Bob Jane T-Marts and a veterinary hospital;
- East – To the east of the subject site is the remaining City Park area comprising Gaymark Lane and commercial properties beyond. It is noted that a former service station is located directly east of Gaymark Lane in which the RAP (JBS&G 2019a) identifies that as an area of environmental concern (AEC, shown on **Figure 3**). However assessments have not identified any evidence of significant contamination entering the site as attributable to this source;
- South – The site is was bound to the south by Allen Place, following which are multiple commercial properties including cafes, a medical centre and pharmacy. Beyond High Street commercial premises are present; and
- West – The site is bound to the west by Station Street, then medium to high density commercial premises. Further to the west is Peach Tree Creek and eventually the Nepean River.

Based on a review of the existing surrounding land uses, the potential for the migration of contamination from off-site sources onto the site is considered to be low. It is noted that the site has been subject to filling to form the current surface conditions and elevations.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.3 Site History

A detailed site history assessment has been provided in earlier JBS&G assessments. Aspects of the site history as relevant to the occurrence of contamination within the extent of the site are briefly discussed following.

A former dry cleaner comprised the northern third of the building (referred to as Shop 3, Gaymark Lane) located at 134-138 Henry Street, Penrith. The shop-front occupied most of the building footprint (>85 %), with the remainder comprising a secluded water closet, storage space and point of sale. The premise was vacant during the period of the investigation. Uncontrolled releases of dry cleaning fluids are anticipated to have occurred from this business which has led to chlorinated ethene contaminated soils in proximity of this area of the site.

Fill based soils have historically been used across the site during previous development phases. Asbestos impact has been identified as associated with the fill based soils and is likely to be distributed on a heterogenous basis through the remaining fill materials on the site.

3.4 Existing Environmental Condition

As described in **Section 1.1** the site had been subject to environmental contamination of soils, predominantly by chlorinated ethenes and asbestos. These impacts will be remediated by the proposed demolition and remedial works to be undertaken with the site development.

3.4.1 Acid Sulfate Soils

No acid sulfate soils were identified during previous investigations or are expected to be present on the site.

3.4.2 Groundwater

Registered groundwater bore information was obtained from the NSW Department of Primary Industries groundwater mapping tools, NSW DPI (2016[1]). A review of the registered bore information indicated that there were thirteen bores within a 1.5 km radius of the Site. Based on the reported geology, topography and depth to groundwater, groundwater migration is expected to occur in a north-westerly direction, towards Peach Tree Creek approximately 1.2 km away. Groundwater has been reported in the surrounding properties within the river gravels layer. Previous JBS&G investigations reported groundwater depths ranging from 6.96 m to 8.05 m below ground surface (bgs), flowing in a north-westerly direction.

Registered groundwater bores located within a 1.5 km radius of the site are used for monitoring, recreational and testing purposes. Given the relatively dense urban use of the site and surrounding properties, in addition to the identified licensed bores, there is a moderate probability of additional undocumented bores near the site. No reported utilisation of groundwater as a drinking water source has been reported.

3.4.3 Surface Water

Rainfall is considered likely to migrate primarily through surface water runoff into the municipal stormwater system. Minor infiltration into the underlying porous soils and surface is also expected in areas of unsealed ground.

The site is largely covered by concrete (pre development), asphaltic pavements and building footprints. As such, surface water generated during periods of rainfall is anticipated to primarily enter the municipal stormwater system; via discharge into onsite stormwater catchment infrastructure or alternatively discharge into stormwater pits within the surrounding roadways.

[1] NSW Department of Primary Industries, 2015. Groundwater Monitoring Overview Map. Http://allwaterdata.water.nsw.gov.au/water.stm. Accessed 8 November 2016.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Increased infiltration of surface water will occur following demolition works and during construction of the Park, and with the redeveloped Park form (**Figure 4**) excluding the area of long term containment.

The nearest water body to the Site is Peach Tree Creek, approximately 1.1 km to the west of the site boundary. Peach Tree Creek ultimately discharges to the Nepean River. Municipal stormwater discharges to the Nepean River.

3.4.4 Fauna and Flora

The site is located within the central business district of Penrith. With this, there is limited opportunity for flora and fauna to establish on the site. Migratory bird species and small areas of vegetation have been observed. A significant existing large Eucalypt tree is present in the southern portion of the site and will be retained with the City Park development (subject to potential site remediation constraints). Significant landscaping / vegetation is proposed with the site development which will substantially alter the flora characteristics of the site.

3.4.5 Meteorology

A review of average climatic data for the nearest Bureau of Meteorology monitoring location (Penrith Lakes[2]) indicates the site is located within the following meteorological setting:

- Average minimum temperatures vary from 5.5 ^{o}C in July to 18.5 ^{o}C in January;
- Average maximum temperatures vary from 17.7 ^{o}C in July to 30.7 ^{o}C in January;
- The average annual rainfall is approximately 728.1 mm with rainfall greater than 1 mm occurring on an average of 71.7 days per year; and
- Monthly rainfall varies from 30.6 mm in September to 121.4 mm in June with the wettest periods occurring on average in January to June.

[2] http://www.bom.gov.au/climate/averages/tables/cw_067113.shtml, Commonwealth of Australia, 2013 Bureau of Meteorology, Product IDCJCM0028 prepared on 1 November 2016 and accessed by JBS&G on 8 November 2016.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Description of Works

A brief outline of the anticipated works to be undertaken on the site is provided following:

- Provision of security fencing at the extent of site and establishment of site facilities / offices;
- Establishment of vehicle exit / entry points to be utilised during construction works;
- Existing trees as to be retained within the site shall be identified and provided with tree protection measures;
- Site services shall be isolated;
- Initial asbestos removal works will be undertaken at existing site structures as informed by the extent of asbestos building materials used and reported in a hazardous materials building survey as previously prepared for the works;
- Removal of minor quantities of other hazardous materials present as identified in the hazardous materials survey;
- Demolition of above ground structures, segregation of materials as per recycling opportunity and removal of demolished materials for recycling / disposal;
- Removal of site pavements in other site areas to allow exposure / observation of site soils;
- Detailed assessment of site soils to determine the extent of fill materials affected by asbestos containing materials (ACM);
- Removal of existing site services (i.e. sewer, stormwater, other conduits etc) and assessment of service corridors for potential presence of chlorinated ethenes / preferential pathways of chlorinated ethene migration;
- Identification of the extent of ACM and chlorinated ethene impacted soils by lateral and vertical dimensions;
- Excavation and segregated stockpiling of the lateral and vertical extent of contaminated soils in a controlled location on the site;
- Completion of an excavation at the central portion of the (area of the site as nominated in JBS&G 2020b and shown on **Figure 5**) to a sufficient vertical extent to contain the extent of contaminated soils below a depth of at least 1 m. Stockpiling of surplus soils from excavation in a segregated clean stockpile location;
- Completion of area of site containment inclusive of geosynthetic clay liner over the extent of retained soils, placement of a marker layer, and re-use of soils as available from the 'clean stockpile' to place a 1 m thick capping layer over the extent of the containment;
- Use of remaining clean stockpile to re-instate excavations as placed for the excavation / removal of contaminated soils; and
- Preparation of site as City Park by services installation and soft and hard landscaping as consistent with the approved City Park plans.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5. CEMP Responsibilities

5.1 Site Owner

It is the responsibility of the Site Owner (Penrith City Council), to ensure an appropriately trained Site Environmental Manager is appointed by the Main Contractor (to be nominated) to undertake the responsibilities set out in **Section 5.2** below.

5.2 Site Environmental Manager – Main Contractor

Works are required to be undertaken which will involve handling of contaminated material. An appropriately trained Site Environmental Manager shall be appointed by the Main Contractor (to be nominated) whom shall be responsible for the following:

- A person in a senior management position in the Main Contractor's organisation (to be nominated) is appointed as the Site Environmental Manager, and given the responsibility for ensuring the CEMP is provided to relevant staff and other stakeholders and implemented appropriately;
- The Site Environmental Manager should be supported by the Main Contractor's Health Safety and Environment (HSE) team;
- The CEMP is reviewed and updated regularly by an appropriately qualified and experienced person to ensure it complies with updates to regulatory requirements and its relevance to site conditions following additional works which may be undertaken at the site;
- A copy of the CEMP should be provided to Council and the Auditor for review and comment, should future updates to the CEMP be undertaken;
- Site personnel or contractors that must conduct intrusive works at the site are inducted into this CEMP and made aware of their responsibilities regarding health and safety and also protection of the environment;
- All site personnel and contractors are made aware of existing contamination and a copy of this CEMP is supplied to anyone conducting intrusive works across the site;
- The health, safety and environmental requirements specific to the contamination issues on the site, as outlined in this CEMP, are complied with;
- Environmental incidents are reported in a timely manner to the appropriate statutory authorities, as necessary in accordance with legislation;
- Management of all operations, employees and subcontractors as relevant to the requirements of this CEMP;
- Ensuring compliance with all environmental requirements outlined in this CEMP and statutory requirements through the engagement of an environmental consultant to conduct external CEMP compliance audits according to the checklist provided as **Appendix C**;
- Liaison with the regulatory authorities in relation to environmental matters;
- Co-ordination of, where necessary, environmental monitoring, data assessment and reporting;
- Where necessary, reviewing environmental reports and inspections and initiating any actions to rectify;
- Participation in environmental incident investigations;
- Participation in environmental meetings and programs;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Oversight of the implementation of environmental management measures at the site; and
- Liaison with the community of the area to address any questions regarding the management areas or this CEMP.

5.3 Competence, Training and Awareness

It is the responsibility of the Site Environmental Manager working on the site to ensure that:

- A person in charge of site works (e.g. Site Foreman, Project Manager, Site Supervisor, or similar) is appointed, for the purposes of implementing the measures outlined within this CEMP, and are to be responsible for ensuring successful implementation of this CEMP including appropriate communication with the Site Owner and/or Site Environmental Manager as required;
- Works are conducted in compliance with the CEMP requirements, in addition to any other specific requirements for the tasks undertaken;
- Notify the Site Owner of any unexpected finds encountered during works;
- Any works with asbestos (when encountered) should give appropriate consideration to requirements of Safe Work Australia, Work Safe NSW and other relevant guidelines, codes of practice and standards; and
- Any works involving hazardous materials, contaminated and waste material should be completed in accordance with relevant legislation, guidelines and standards.

It is the responsibility of the Main Contractor (to be nominated) to:

- Ensure all staff working on the site are provided with the environmental training required to competently carry out their work;
- Ensure all site staff and contractors are inducted before commencing work in the Site Office by the Site Manager or other relevant personnel; and
- Maintain Training / Induction Register in the Site Office.

5.4 Contingency and Emergency Response Plans

It is the responsibility of the Main Contractor (to be nominated) to ensure that:

- Induction for all staff and subcontractors working on the site includes training on the potential environmental emergencies, relevant environmental safeguards and risk mitigation measures.
- An Incident and Emergency Response Procedure (IERP) will be established prior to commencement of work and communicated to all site personnel and followed for the duration of the works; and,
- Contact details for site emergency response personnel on site are detailed in **Table 5.1.**

Table 5.1: Emergency Contacts

Emergency Contact	Contact number
Penrith City Council	02 4732 7777
Emergency Services (Police, Fire, Hazmat, Ambulance)	000/112
Penrith Medial Centre (61-79 Henry St Penrith)	02 4721 8755
Nepean Hospital (Derby St Kingswood)	02 4734 2000
SES	132 500
Work Safe NSW	9370 5877
EPA Pollution	131 555
Site Environment Manager	To be confirmed
Site Manager	To be confirmed

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5.5 Monitoring, Inspection and Auditing

It is the responsibility of the Site Environmental Manager to ensure that:

- Environmental monitoring as required by the CEMP is undertaken in accordance with the requirements of the CEMP and by a person appropriately qualified and experienced to undertake the specific monitoring. Environmental monitoring reports are made available and reviewed to ensure compliance with relevant environmental criteria established for the project;
- Any exceedances of environmental monitoring criteria are assessed and rectified to eliminate / mitigate the potential for future exceedances;
- Environmental inspections are undertaken weekly by an appropriately qualified and competent person and appropriately documented in an Environmental Inspection Report, and that additional erosion and sediment control inspections are conducted after more than 10 mm of rain in a 24-hr period;
- A visual inspection and validation sampling are undertaken by a suitably qualified Environmental Consultant after the completion of bulk earthworks, the removal of each stockpile and after the completion of construction works, in order to ensure works do not result in the spread of contamination and that all contaminated material is removed;
- Copies of Environmental Inspection Reports prepared by an appropriately qualified and competent person, as kept with development project records; and
- A compliance audit (**Appendix C)** is undertaken at monthly intervals when activities are taking place during the site preparation works, construction works and also at the completion of construction. It is recommended that a compliance audit should be undertaken a year after the completion of site development, and then at a time interval deemed appropriate and effective by the Site Owner.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6. Management of Potential Impacts

6.1 Introduction

Management measures for the construction of the site are described in **Section 6.4** below. This table forms the management framework of this CEMP and should be referred to and implemented by the responsible person in the allocated timeframes to minimise the impacts as result of the site activities.

Based on the Description of Works in **Section 4** above, the site preparation works phase is likely to have the highest environmental risks associated with it, as described in **Section** Error! Reference source not found. above. The activities of key concern are likely to be the handling, movement, disposal of excavated materials, and importation of fill material and the associated dust, erosion and sedimentation impacts.

Intrusive works for site remediation and future service installation will not intercept groundwater based on reported depths (JBS&G 2019 and 2020b). Noise impacts are likely to be associated with all phases of the project. All construction activities associated with the development are considered to result in a degree of environmental impact and should be managed according to the management measures outlined under the relevant aspect.

Management measures for the following aspects are included in the table below:

- **Section 6.4.1 Soil:**
    a. Contaminated soils (chlorinated ethene and asbestos contamination);
    b. Imported soils;
    c. Erosion and sediment control; and
    d. Contamination of soils (by the works).
- **Section 0 Air:**
    a. Air quality – asbestos and chlorinated ethene vapours; and
    b. Dust, odour and air quality.
- **Section 6.4.3 Flora and fauna**
- **Section 6.4.4 Groundwater**
- **Section 0 Waste management** (inclusive of Waste Management Plan)
- **Section 0 Health and safety:**
    a. Fire;
    b. Safe access and security of the site during works;
    c. Contaminated material handling;
    d. Unexpected finds; and
    e. Noise.
- **Section 6.4.7 Amenity**
    a. Noise.

The CEMP Compliance Audit Checklist is provided as **Appendix C** and should be completed by an appropriately qualified Environmental Consultant to ensure that the management objectives

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

outlined below are being met and if not, additional measures are implemented in order to meet the desired outcome.

6.2 Frequency of Compliance Checks

It is recommended that these audits be completed at monthly intervals when activities are taking place during the site preparation works, demolition, remediation and associated construction works and also at the completion of construction. It is recommended that a compliance audit should be undertaken a year after the completion of site development, and then at a time interval deemed appropriate and effective by the Site Owner. Each aspect and potential impact associated with the description of works is provided with a corresponding reference number to be utilised during subsequent site CEMP compliance audits.

6.3 Assessment of Risk

Potential environmental risks have been identified through assessment of the existing environmental condition of the site against the amount of change the development will generate. The risk of each potential impact was assessed according to the risk matrix in **Table 6.1** below.

Table 6.1: Risk of Potential Impact Matrix

RISK MATRIX		Severity of Consequence				
		Severe	Significant	Moderate	Minor	Negligible
Likelihood	Very Likely	Very High	High	Medium - High	Medium	Low - Medium
	Likely	High	Medium - High	Medium - High	Low - Medium	Low
	Possible	Medium - High	Medium - High	Medium	Low - Medium	Low
	Unlikely	Medium	Medium	Low - Medium	Low	Low
	Very Unlikely	Medium	Low - Medium	Low	Low	Low

The risk levels identified for each potential impact below were identified through consideration of the likelihood and the corresponding severity of the impact. The management measures provide controls to mitigate the risk associated with the activities associated with the described development of the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4 Management Measures of potential impacts

6.4.1 Soil

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Contaminated soils	**1**	Site Environmental Manager	Cross contamination of clean soil as result of stockpiling of contaminated excavated material.	Inadequate isolation of soils and inadequate erosion controls.	**Medium - high**	Contaminated material stockpile area is validated clean after use and minimal runoff and erosion occurring onsite.

Management Measures

- Ensure stockpiles are placed on flat ground.
- Limit the ground area to be disturbed by stockpiling material by implementing a system of staged excavation, stockpiling, classification, removal and validation to one bench area at a time.
- Stockpiles to be covered with a water proof material (i.e. HDPE plastic) and weighed down barrier when remaining for more than 7 days.
- Replace a protective barrier between ground surface and impacted stockpile between each stockpiling event.
- When stockpile is uncovered, the stockpile is to remain damp during excavation works as required. Care should be taken to ensure that runoff is not generated during wetting down events.
- Establish silt fence enclosures around stockpiles as required.
- Securely stockpiled separately and inspected for signs of contamination.
- Inspected and sampled by an appropriately qualified person when stockpile footprints cover an unsealed surface.
- Undertake classification of excavated soils in NSW EPA Waste Classification Guidelines Part 1: Classifying Waste, and relevant waste regulations where any soils become surplus to site requirements.
- Immediately notify Site Environmental Manager (SEM) of any suspected or potentially contaminated ground exposed during construction activities outside of extent of environmental consultant advised extent of chlorinated ethene and asbestos contaminated soils. All work must cease within the vicinity of the actual or suspected contaminated land and the area fenced off.
- If contaminated ground is discovered, divert surface runoff away from the contaminated area.
- Surface runoff water contaminated by exposure to the contaminated ground must be contained and treated prior to discharge.
- Where asbestos is encountered, appropriate consideration of requirements of Safe Work Australia, Work Safe NSW and other relevant guidelines, codes of practice and standards will be required. Reference shall be made to the Asbestos Management Plan for specific asbestos requirements.
- Implement the Unexpected Finds Protocol at **Appendix B** if hazards arise from unexpected sources and/or in unexpected locations.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Imported soils	**2**	Environmental Manager, Site Supervisor	Importation of contaminated/impacted fill or reuse of contaminated soil.	Improper classification of imported fill or excavated material	**Medium**	No contaminated material entering the site or reuse of contaminated soil onsite.
Management Measure						
• Any existing soils excavated to be reused on the site must be analysed and classified by an appropriately qualified and experienced environmental consultant, in accordance with relevant NSW EPA endorsed guidelines including the "Waste Classification Guidelines" 2014, prior to reuse/disposal. • Any fill material that is imported onto the site must comprise Virgin Excavated Natural Material (VENM), Excavated Natural Material (ENM) or other suitable material in accordance with the relevant Resource Recovery Exemption issued under the Protection of the Environment Operations (Waste) Regulation 2014. • No recycled or other material containing asbestos shall be imported to the site.					

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Erosion and Sediment control	**3**	Site Environmental Manager	Erosion of material into surface water, surrounding roads	Inappropriate erosion protection, traffic and plant management	**Medium - high**	No stockpile material entering surface water bodies.

Management Measures

- Appropriate sediment and erosion controls must be implemented and maintained for the duration of soil management works, consistent with the Penrith City Council Engineering Specification for Civil Works (2017).
- Place temporary stockpiles away from stormwater drains and drainage lines.
- Ensure stockpiles are placed on flat ground.
- Limit the height and size of stockpiles to a maximum 2:1 height to width ratio, and no higher than 2 m for topsoil and 3 m for subsoil / contaminated soils.
- Stockpiles to be covered with a water proof material (i.e. HDPE plastic) and weighed down barrier when remaining for more than 7 days.
- When stockpile is uncovered, the stockpile is to remain damp during excavation works as required. Care should be taken to ensure that runoff is not generated during wetting down events.
- Establish silt fence enclosures around stockpiles as required.
- Silt fences are to be installed around the entire boundary of the site.
- Stockpiles should be constructed with water diversion features upslope, and/or construction of earth banks to divert water around stockpiles.
- Remove excavated materials offsite as soon as practicable to minimise risk of run-off into adjacent areas.
- Ensure that all on-site stormwater management infrastructure is operational and appropriately designed to handle stormwater generated on the site.
- The Site Environmental Manager must inspect the stormwater and drainage measures on a weekly basis and after any rain event. Records of observations during these inspections should be kept in the site register.
- All vehicles exiting the site will pass through a wheel wash minimise tracking of dirt and potentially contaminated soil or sediment to enter onto local roads.
- Specify a “dirty zone” and ensure no decontaminated equipment be contaminated before leaving site.
- Surface water runoff from outside the “dirty zone” will be stored on site for reuse.
- The wash down area should have appropriate sediment controls around it and be large enough to hold all waste water generated.
- The washdown area should be clearly signposted to alert subcontractors and staff of their responsibilities.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Contamination of soils	**4**	Environmental Manager, Site supervisor, Site personnel	Contamination of soil and / or water from fuel spills.	Improper containment of fuel sources or damaged machinery / equipment.	**Medium - High**	Eliminate soil or water contamination onsite due to oil or fuel spills.

Management Measures

- Site staff are to be made aware of the extent of chlorinated ethene and asbestos contaminated soils present across the site.
- Site staff are to be made aware of a segregated stockpile location of chlorinated ethene and asbestos contaminated soils that is proposed to be retained on site.
- The extent of the chlorinated ethene and asbestos contaminated soils is to be minimised , subject to stockpile dimension requirements, to mitigate the potential for soils impact.
- The upper 100 mm of soils present underlying the chlorinated ethene and asbestos contaminated soils stockpile shall be included with the stockpiled soils when transferred for on-site containment as per the preferred remedial approach. These soils shall be assumed to have been caused to be contaminated by the stockpiling of contaminated soils overlying.
- Ensure all staff are aware of the Site Emergency Plan and the Spill Management Procedures during the Site-Specific Induction.
- Spill kits will be kept onsite and all site personnel trained to use them. If a spill to water occurs, the Site Environmental Manager is to be notified immediately to implement corrective actions.
- A record of any spill event is to be kept and actioned as soon as possible.
- No chemicals, fuels or wastes will be stored within 50 m of any natural or stormwater drainage lines or on foreshore. All such substances must be contained in sealed vessels of appropriate volumes and stored in bunded areas.
- Ensure all chemicals are stored in accordance with the manufacturer's instructions and the Material Safety Data Sheet (MSDS).
- Machinery and equipment to be inspected and maintained off-site where possible.
- Daily pre-start checks to be undertaken for all onsite plant and equipment.
- Refuelling of equipment, oil changes, wash down and degreasing of machinery shall occur on hardstand, appropriately bunded and contained areas equipped with a spill kit (appropriate to diesel spills).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.2 Air

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Air Quality - Asbestos	**5**	Site Environmental Manager, Site Supervisor	Exposure to site workers and / or surrounding residents to Asbestos Containing Material (ACM)	Unexpected discovery of ACM.	**Medium**	Minimise as far as possible the ACM exposure to site personal and surrounding residents as practicable.

Management Measures

During any fill/soil excavation in areas where asbestos has been or is identified, demolition / removal of asbestos containing materials from site structures, transport or placement works on site involving (>10 m^2) bonded ACM and/or friable ACM:

- Airborne asbestos fibre monitoring will be undertaken using calibrated portable air sampling pumps;
- Air monitoring should be undertaken by a competent person, as defined in WHS Regulation (2011) or a licensed asbestos assessor, for works involving non-friable asbestos. For works involving friable asbestos, air monitoring must be undertaken by a WorkCover Licensed Asbestos Assessor (LAA);
- Monitoring locations shall be determined by the competent person or LAA, but shall include at least four locations surrounding the daily specific work area. At the end of each monitoring period the pump and attached filter will be collected and analysed at a National Association of Testing Authorities (NATA) accredited laboratory;
- Monitoring works shall be conducted in accordance with the National Occupational Health and Safety Commissions' Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres 2nd Edition (NOHSC:3003 (2005)) and the procedures and results shall be NATA accredited;
- The following action levels will be applied upon receipt of daily results, as outlined in the Safe Work Australia (2016) (SWA):
  - Reading of less than 0.01 fibres/mL – control measures in place are working effectively, site works to continue;
  - Reading between 0.01 and 0.02 fibres/mL – a review of control measures shall be completed in the work area;
  - Reading greater than 0.02 fibres/mL – works shall cease until the cause of contamination is identified and rectified;
- It is noted that these action levels adopted are more conservative than the exposure standard for airborne asbestos (0.1 fibres/mL (TWA)) as outlined in Workplace Exposure Standards for Airborne Contaminants (SWA 2018) for an 8-hour shift;
- The results of air monitoring will be available on a 24-hour turnaround time basis. While monitoring is undertaken, daily air monitoring reports shall be displayed in a common area outside of the asbestos work area (e.g. site office or lunch shed) or be able to be produced upon request;
- Monitoring requires to be undertaken until the containment cell / long term encapsulation of impacted soils is completed and validated.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Air Quality – Chlorinated Ethenes	**6**	Site Environmental Manager, Site Supervisor	Exposure to site workers and / or surrounding residents to Asbestos Containing Material (ACM)	Unexpected discovery of ACM.	**Medium**	Minimise as far as possible the ACM exposure to site personal and surrounding residents as practicable.

Management Measures

During any works involving the active handling of soils known to be impacted with chlorinated ethenes:

- Air monitoring shall be undertaken using a field portable GC-PID in proximity of the area of soils handling and at representative locations on the site boundary at intervals of at least three times daily;
- Airborne levels of chlorinated ethenes inclusive of tetrachloroethene (PCE), trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE) shall be quantified over a sampling duration of at least two min utes at each sample location;
- Airborne levels of PCE, TCE and cis-1,2-DCE shall be assessed to ambient air criteria as protective of site and business district exposures of 0.8, 0.008 and 0.03 mg/m^3 respectively. It shall be ensured that the monitoring instrument as adopted for the project is able to quantify to these levels;
- Where exceedances are reported then works shall be undertaken to eliminate and/or mitigate chlorinated ethene vapour emissions as consistent with the scope of actions available in this CEMP.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Dust, Odour and Air Quality	**7**	Site Supervisor, Site personnel	Emission of dust that could have health and / or amenity impacts on nearby residents.	Demolition of structures, excavation of soils, vehicle movements and construction activities.	**High**	Prevention of dust travel beyond the site boundary.

Management Measures

- Exposed potentially impacted fill or soils in the walls and floors of excavations and stockpiles of spoil should be kept moist to prevent the generation of dust from these sources.
- Care should be taken to not over-wet excavations and/or stockpiles such that excess runoff is generated.
- Works should cease should visible dust be migrating from the work site area, until such time as dust is controlled or conditions causing dust migration (e.g. excessive wind) improve.
- Any non-compliances or migration of dust from site boundaries should be reported to the Environmental Manager and appropriate information recorded in the Environmental Incidents Register in **Appendix A.**
- Limit the height and size of stockpiles to with a maximum 2:1 height to width ratio.
- Stockpiles to be covered with a water proof material (i.e. HDPE plastic) and weighed down barrier when remaining for more than 7 days.
- Install temporary fencing with shade cloth screens along the boundary of the site.
- Apply a maximum speed limit of 10 km/h on surface and unsurfaced haul roads and in work areas.
- Trucks used for transport of spoil will be fully enclosed and covered to prevent escape of materials during transport.
- Static air monitoring should be undertaken at the along each site boundary by EPA approved air monitors on an ongoing basis throughout all construction stages and if any recordings are above adopted air monitoring criteria, works must cease immediately and mitigation measures such as dust suppression measures implemented immediately.
- Inspect monitoring readings in any event of high dust emission, these data observations should be recorded in the site register.
- All construction equipment will be maintained to ensure exhaust emissions comply with requirements of the relevant standards of the *Fuel Quality Standards Act 2000*.
- Inspect the site and nearby area daily for evidence of odours (if present) leaving the site. Where works are likely to encounter any offensive odours or if site conditions such as high winds occur, site inspections should be ongoing and a priority.
- If odours are encountered the following actions should be undertaken:
  - Reduction in earthworks activities within odorous material areas during adverse meteorological conditions; and,
  - Application of odour masking solutions at the odour source or between identified source(s) and receptor(s).
- Details of any complaints should be recorded in a site register and reported back to Council.
- If complaints are received regarding dust, the frequency of water spraying or dry removal will be increased and recorded in the site register.
- Inspect, and if required, sweep roads at the end of each day and / or when rain is likely.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.3 Flora and fauna

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Flora and Fauna	**8**	Supervisor, Site personnel	Unintended destruction of vegetation due to trampling by site equipment or storage of material or equipment and incorrect removal or trimming.	Unclear site induction regarding the maintenance of vegetation and improper signage of protected areas.	**Medium**	No unintentional removal of vegetation occurs.

Management Measures

- Where possible unload excavation machine, plant and equipment as close to where they are required to minimise the area being impacted.
- Ensure contractors are inducted in the avoidance of disturbing vegetation.
- Establish No Go Zones to restrict works to within the area of proposed disturbance and to minimise the potential for affecting flora and fauna outside of the work area.
- Do not place stockpiled materials inside vegetation protection areas or within 5 m of trees to be retained.
- Ensure stockpiling of soil that may contain seed of exotic species is away from adjacent vegetation or stormwater drains where they could be spread during rainfall events.
- Ensure all vehicles and equipment entering the site are weed free.
- Trees to be retained shall be managed and fenced off from the proposed development with a 1.8m high chain wire mesh supported by robust posts. Any tree to be retained must be clearly signed 'TREE PROTECTION ZONE, DO NOT ENTER'.
- No development or activity must occur within the fenced (Tree Protection Zone) TPZ.
- Demolition works within the TPZ of trees to be preserved shall be carried out so as to avoid damage to tree roots. Manual excavation shall be carried out under the supervision of the project Arborist to identify roots critical to tree stability. Where the Project Arborist identifies roots to be pruned within or at the outer edge of the TPZ, they should be pruned with a final cut to undamaged wood. Pruning cuts should be made with sharp tools such as secateurs, pruners, handsaws or chainsaws. Pruning wounds should not be treated with dressing or paints. It is totally unacceptable for roots within the TPZ to be pruned with machinery such as backhoes or excavators.
- Where roots within the TPZ are exposed by excavation, temporary root protection should be installed to prevent them drying out.
- All areas enclosed by protective fencing must have the entire ground surface mulched to a depth of 75 mm with composted Eucalyptus leaf and woodchip to help retain soil moisture and reduce erosion.
- Where stormwater and sewer lines need to be installed within the TPZ of trees nominated for preservation trenching for stormwater/sewer installation within the TPZ and SRZ shall be avoided. Adopt directional drilling/approved under boring techniques as per Section 4 of AS4970 CL.4.5 to avoid adverse impacts on tree roots.
- The crowns of all significant trees nominated for preservation are clear of the proposed development.
- Install tree trunk/ branch batten protection boards as per Section 4.5.2 of Australian Standard (AS4979-2009): Protection of Trees on Development Sites.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.4 Groundwater

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Groundwater	**9**	Site Environmental Manager, Site Supervisor, Site personnel	Interception of groundwater and contamination of surface water and soil.	Intrusive or penetrative works associated with exaction, service installation, trenching and foundations.	**Low**	No surface water or soil contamination as result of intercepted groundwater.

Management Measures

- No uncontrolled abstraction of groundwater at the site can occur without first assessing the quality of groundwater if required to be abstracted.
- If any potentially contaminated groundwater requires management during works on site, will be done so by either; removal as a waste by a licensed contractor and disposed off-site in accordance with relevant waste regulations and guidelines, or assessed and treated where required prior to discharge under appropriate approval to enable discharge to stormwater and for sewer (with treatment) if required.
- Avoid excavation below 6 m of the current surface level during construction due to reported groundwater levels (JBS&G 2019).
- In the case that groundwater is intercepted, the contractors must immediately cease any further excavation work and adopt the following protocol:
  - Intercepted groundwater must be contained and not enabled to leave the excavated pit, in the case of potential overflowing the rim of the excavation should be sandbagged;
  - Intercepted groundwater should be pumped from the excavation and into a sealed container, care should be taken not to withdraw more water than necessary;
  - The excavation should be appropriately backfilled and compacted; and,
  - The collected groundwater should be classified by an appropriately trained environmental consultant and if contamination levels are reported above adopted guidelines, removal as a waste by a licensed contractor and disposed off-site. If the groundwater is not classified as contaminated and achieves stormwater criteria, stormwater disposal is permitted.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.5 Waste Management

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Waste Management	**10**	Site Environmental Manager, Site Supervisor, Site personnel	Contamination of receiving environment by waste material.	Incorrect, or lack of classification of waste materials. Improper disposal of waste material.	**Medium**	No impact on receiving environment as result of waste.

Management Measures

- Demolition works are to be staged so as to allow segregation of materials types to maximum opportunities for off-site recycling. This shall at least include separation of asbestos based materials, masonry / concrete based materials, timber building materials etc;
- Demolition works are to be staged to ensure that asbestos containing materials / other potential hazardous materials (i.e. SMF, PCB containing capacitors etc) are removed from site structures prior to bulk demolition works. These materials shall be separated / segregated and disposed as hazardous materials as consistent with relevant provisions of NSW EP)A (2014);
- All asbestos containing materials as removed during demolition works are to be wrapped in plastic / placed in plastic wrapped waste bins and removed from site as asbestos waste;
- The remedial works require to be staged / undertaken in a manner to mitigate the requirement to dispose of soils from the site. This shall include controlled stockpiling / tracking of impacted and non-impacted soils, re-use of excavated soils to form the containment cell to re-instate excavation of contaminated soils and preferential selection of non-impacted virgin excavated natural material to be disposed form the site where there is a surplus of soils;
- Any construction waste soil or other soil material to be disposed off-site should be analysed and classified by an appropriately qualified and experienced environmental consultant, in accordance with relevant NSW EPA guidelines including the “Waste Classification Guidelines” 2014, prior to off-site disposal.
- Surplus demolition materials / soils not suitable to remain on-site are to be transported to an appropriately licensed waste facility by an EPA licensed waste contractor in accordance with relevant NSW EPA guidelines.
- Materials removed from site for waste disposal should be classified prior to removal and tracked from ‘cradle to grave’ with transport and disposal documentation maintained consistent with relevant regulatory requirements.
- Any asbestos waste must be removed, transported and disposed as special waste in accordance with relevant guidelines and legislative requirements.
- Remove rubbish and debris offsite to prevent it entering stormwater / drainage lines and causing environmental harm.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.6 Health and Safety

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Fire	**11**	Site Supervisor, Site personnel	Out of control fire which threatens safety and infrastructure.	Use of spark producing equipment on high fire risk days	**Low - Medium**	No occurrence of fire onsite.
Management Measures						
• Communicate total fire ban declarations and resultant work restrictions to staff during daily tool box briefings as required. • During total fire bans, fit spark arrestors to any items of plant that have the potential to discharge sparks. • All personnel involved in welding, grinding, thermal or oxygen cutting, heating or other fire or spark-producing operations will be trained in fire prevention, safety and basic fire-fighting skills. • Induction for all staff and subcontractors working on the site includes training on the potential environmental emergencies, relevant environmental safeguards and risk mitigation measures. • No smoking onsite						

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Safe Access and Security of the Site During Works	**12**	Site Environmental Manager, Site Supervisor	Injury or harm to site worker or general public.	Accessing the site and due to improper security or slips, trips and falls on the work site	**Medium**	No unauthorised access to site and no incidents of injury or harm onsite.
Management Measures						

• The site must be fenced, appropriately signed to inform and restrict unauthorised access.
• The site is appropriately lit and free from trip hazards to ensure safe access and reduce the risk of slip, trips and falls
• Only work during works hours and ensure site is securely locked up at all times.
• All personal onsite complete a site induction and are aware of hazards.
• Site workers only perform tasks within their capabilities and only operate machinery in which they are licensed.
• All site personal abide by relevant Occupational Health and Safety legislation provided in **Section 2.3**: Legislative Framework:
  ○ *Work Health and Safety Act 2011 (WHS Act 2011)*
  ○ *Work Health and Safety Regulation, 2017 (WHS Regulations, 2017)*
• All site personal must also abide by national relevant national legislation including:
  ○ *Road Transport Reform (Dangerous Goods) Act 1995*
  ○ National Code of Practice for the Prevention of Falls in General Construction (2008)
  ○ Workplace Injury and Disease Recording Standard in the Workplace (AS 1885.1-1990)
• All loading, unloading and handling of materials for the project must be carried out wholly within the site boundaries.
• Construction vehicle access and egress must be undertaken from Bay Road only.
• During construction, delivery vehicles, concrete trucks and trade vehicles must be unloaded on site as close as possible to the required location.						

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Contaminated Material Handling	**13**	Site Environmental Manager, Site supervisor, site personnel	Exposure to site occupants and workers to soil contamination.	Not wearing personal protective equipment (PPE), unsecure access, and incorrectly handling soil or site water.	High	No one is unacceptably exposed to soil contamination.

Management Measure - Preliminary Construction Phase

- The site must be suitably signposted and barricaded to inform site occupants / workers to the potential environmental hazards within the site.
- All site workers must wear appropriate PPE onsite, which includes long trousers, long sleeved shirts, appropriate protective footwear and gloves.
- All site workers are to be inducted. The induction is to include environmental responsibilities and hazards associated with contaminated soils (i.e. when in contact with contaminated soils, workers must wear gloves, avoid touching their face and mouth, wash hands before eating and after being onsite)
- The site entrance must be securely shut during works and locked afterhours to prevent unauthorised access.
- All site boundaries should be secured to prevent any unauthorised access.
- Corrective and / or preventive actions are developed and implemented as soon as practicable.
- Records are kept of any environmental nonconformities and associated action taken in the Environmental Incidents Register Provided as **Appendix A.**
- Unexpected finds, such as unexpected soil contamination (e.g. staining, odorous), asbestos containing material etc should be managed in accordance with the unexpected finds protocol provided in **Appendix B.**
- Any unexpected finds during the construction phase should be notified to the Site Manager for appropriate action.

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Unexpected Finds	**14**	Site Environmental Manager, Site supervisor, site personnel	Exposure of anyone onsite to contaminants of potential concern.	Exposure of potentially impacted soil through earthworks and other subsurface works.	**Medium - High**	All unexpected finds and environmental non-conformities are reported and ameliorated immediately.

Management Measure - Preliminary Construction Phase

- Unexpected finds, such as unexpected soil contamination (e.g. staining, odours), asbestos material, unexploded ordnances, small arms ammunition etc should be managed in accordance with the unexpected finds protocol provided in **Appendix B.**
- The induction program for site staff and contractors includes the need to notify the Site Manager of any nonconformities and unexpected finds to the CEMP as soon as practicable.
- Corrective and / or preventive actions are developed and implemented as soon as practicable.
- Records are kept of any environmental nonconformities and unexpected finds and associated action taken in the Environmental Incidents Register Provided as **Appendix A.**
- Any unexpected finds during the construction phase should be notified to the Site Manager for appropriate action.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4.7 Amenity

Aspect	Reference	Responsible Person	Potential Impact	Cause	Risk	Management Objective
Noise	**15**	Site Environmental Manager, Site Supervisor, Site personnel	Emission of annoying and impeding noise levels.	Use of loud and unserviced equipment	**Low - Medium**	Minimal emission of noise and no / few complaints, and any complaints resolved.

Management Measures

- Notify the Penrith City Council at least 20 business days prior to commencement of work.
- Only conduct works during the specified working hours.
- Proposed working hours on this project are:
  - 7:00 am to 6:00 pm Monday to Friday; and
  - 8:00 am to 3:00 pm Saturdays.
- No work will be conducted on Sundays and Public Holidays.
- Complaints related to noise or any other aspect of works will be noted by the contractor and forwarded to the Project Manager for resolution.
- All deliveries to and from the site must be made during the scheduled work hours.
- Noise from machinery will be minimised by:
  - Selecting machinery that makes less noise;
  - Enclosing noisy equipment, if practicable;
  - Fitting and maintaining appropriate mufflers on earth-moving and other vehicles on site;
  - Plant will be turned off or powered down when not in use;
  - Ensuring plant is well maintained; and,
  - Ensuring plant is not idling unnecessarily.
- Engine and exhaust brakes will not be used on site except for emergency situations.
- Neighbours will be informed of the nature, duration and hours of work if noise from construction activities are likely to impact on them, prior to works being carried out.
- Details of any complaints should be recorded in a site register and reported back to Council.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. CEMP Review

It may, on occasion, be necessary to revise the CEMP to reflect changes to legislation and/or regulatory requirements and/or changes in site conditions, where these influence implementations of the CEMP, for example:

- Revision of the CEMP will be necessary if the details in the CEMP have changed (i.e. further assessment provides additional data to inform the CEMP or unexpected impacts are encountered during site works);
- Revision of the CEMP will be necessary on completion of development works to incorporate the design details;
- Revision of the CEMP should be undertaken by an appropriately qualified and experienced environmental consultant (JBS&G);
- Copies of the revised CEMP should be distributed to the current Environmental Manager for on-going implementation;
- A copy of the revised CEMP should be provided to Council for review and comment following any changes; and
- The Site Environmental Manager should ensure that the most current, up-to-date, CEMP is provided to any workers on site as part of the CEMP induction requirements for works on site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquiries.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Changes to the subsurface conditions may occur subsequent to the works described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

Appendix A Environmental Incidents Register

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

CEMP INDUCTION REGISTER

The purpose of the induction register is to acknowledge acceptance and compliance with the procedures outlined within this CEMP by signing the attached log. Copies of this document must be made available for review and be readily available at the job site.

The Induction Register is required to be completed by each person inducted into the CEMP.

Person	Position	Signature	Date

COMPLAINTS AND ENVIRONMENTAL INCIDENT REGISTER

The purpose of the Complaints and Environmental Incident Register is to maintain a register of complaints from local residents or concerned parties, which will include a record of any action taken with respect to the complaints.

The Complaints and Environmental Incident Register is required to be completed immediately following the receipt of any complaints associated with works undertaken at the site.

Date	Time	Type of Communication	Name, address and phone number of complainant	Nature of Complaint	Corrective Action	Dates of Response	Signature

SURFACE COVER – AD HOC INSPECTION CHECKLIST

The following checklist should be used on an ad hoc basis. It may be appropriate for such assessments to be made following heavy rainfall episodes which could disturb or remove surface cover and expose soil materials or visible ACM.

Compliance Questions	Yes (√/x)	No (√/x)	Outcome
Site Capping Layer Inspection Date:			
Is there any degradation in site cover?			If no, no further action is required.
			If yes, the site surface should be repaired appropriately to ensure subsurface soils are adequately covered.
Have any soils or visible ACM been exposed?			If no, no further action is required.
			If yes, any visible ACM fragments exposed will need to be removed in compliance with the requirements of the WorkCover Code of Practice 'How to manage and control asbestos in the workplace', other relevant regulatory requirements; Any other waste material exposed or other unexpected finds should be managed in compliance with this EMP and relevant regulatory requirements.

DUST MANAGEMENT CHECKLIST

During intrusive works that will disturb asbestos or other impacted soils, the following checklist should be completed on a daily basis.

Compliance Questions	Yes (√/x)	No (√/x)	Outcome
Dust Management Inspection Date:			
Has all exposed soil/fill in stockpiles and walls and floors of excavations been kept moist?			If no, corrective actions such as wetting down the area with a hose must be taken.
			If yes, no further action is required.
Is excess run-off being caused by over wetting?			If no, no further action is required.
			If yes, stop wetting and ensure appropriate sediment controls are in place.
Is visible dust migrating from the work site area?			If no, no further action is required.
			If yes, work should cease until such time as dust is controlled or conditions causing dust migration (e.g. excessive wind) improves.
Any non-compliances or migration of dust from site boundaries should be reported to the **Environmental Manager** and appropriate information recorded in the Environmental Incidents Register.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Penrith City Park CEMP Compliance Audit Checklist

Date:			Assessor:	
CEMP Ref	**Potential Impact**	**Requirement**	**Evidence of Implementation**	**Compliance (Y/N)**
1	Cross contamination of clean soil as result of stockpiling of excavated material.	Contaminated material stockpile area is validated clean after use and minimal runoff and erosion occurring onsite.		
2	Importation of contaminated material.	No contaminated material entering the site or reuse of contaminated soil onsite from site.		
3	Erosion of stockpiled material into surface water.	No stockpile material entering surface water bodies.		
4	Contamination of soil and / or water from fuel spills.	Eliminate soil or water contamination onsite due to oil or fuel spills.		
5	Exposure to site workers and / or surrounding retail areas to Asbestos Containing Material (ACM)	Minimise as far as possible the ACM exposure to site personnel and surrounding businesses as practicable. Confirm results of monitoring.		
6	Exposure to site workers and / or surrounding retail areas to chlorinated ethene vapours	Minimise as far as possible the vapour exposure to site personnel and surrounding businesses as practicable. Confirm results of monitoring.		
7	Emission of dust that could have health and / or amenity impacts on nearby residents.	Prevention of dust travel beyond the site boundary.		
8	Unintended destruction of vegetation due to trampling by site equipment or storage of material or equipment and incorrect removal or trimming.	No unintentional removal of vegetation occurs.		
9	Interception of groundwater and contamination of surface water and soil.	No surface water or soil contamination as result of intercepted groundwater.		
10	Maximising recycling opportunities / waste minimisation.	Segregation of waste materials as per waste classification / potential to recycle		
10	Contamination of receiving environment by waste material.	No impact on receiving environment as result of waste.		
10	Waste tracking	Material / waste tracking records available for all material removed from site.

1. Introduction

1.1 Background

JBS&G Australia Pty Ltd (JBS&G) was engaged by Penrith City Council (PCC, the client) to prepare a Long Term Environmental Management Plan (LTEMP) for the future management of the encapsulated environmentally impacted soils within the western portion of the Penrith City Village Park (City Park, the site, **Figure 1**). The site is legally identified as Lot 1 in DP 164798 and Lot 1 in DP 252457 (134 to 138 Henry Street), Lot 10 and 11 in DP 553665 (140 to 142 Henry Street), Lot 2 in DP 556075 (144 Henry Street), Lot 3 in DP1200790 (42 to 44 Station Street), Lot 1 in DP 526304 (48 to 50 Station Street) and Lot E in DP 163176 (46 Station Street). Notwithstanding the descriptions, portions of the site are also referred to as being present with the former Allen Place Car Park. The area of the City Park occupies a total area of approximately 7000 m^2. The site is referred to as the extent of encapsulated environmentally impacted soils and is restricted to an area of 1300 m^2 in the western portion of the City Park.

Contamination has been identified within the extent of the site prior to the redevelopment as the City Park. This has included asbestos containing materials (ACM) as present within historically imported fill materials as used with the initial development of the site and chlorinated ethene impacted soils as associated with a dry cleaners that previously operated at 134-138 Henry St.

The contaminated soils have been identified and segregated during the construction of the City Park and consolidated. The extent of contaminated soils has then been placed into a purpose designed containment within the site sub-surface to be managed into the future. An engineered cap is placed over the contained soils to control potential human and ecological exposures in the future.

This LTEMP is also required as part of the contaminated land site audit process. The site is considered suitable for use given the presence of an appropriately engineered capping layer to retain the contaminated soils and subject to implementation of this LTEMP. This LTEMP is required to ensure that the environmentally impacted soils (including asbestos affected materials) are appropriately managed to ensure continued protection of human health for future site workers, occupiers, visitors and contractors engaged to undertake works within the City Park, or otherwise members of the public whom will use the recreational / open space facilitations associated with the Park.

Through the presence of asbestos as a known contaminant in the soils this LTEMP has been prepared specifically in accordance with Clause 429 of the *Work Health and Safety Regulation* (2017) that states, *"If asbestos or ACM is identified at a workplace under clause 422, or likely to be present at a work place from time to time, a person with management or control of the workplace must ensure a written plan (an asbestos management plan) for the workplace is prepared".*

This LTEMP applies only to the environmentally impacted soils as present within the encapsulated area identified as the western portion of the City Park, as shown in **Figure 2**, and does not apply to the greater City Park area. It is not intended to apply to major excavations, earthworks or construction activities. A specific management plan should be prepared in the event that any major works are proposed for the encapsulated area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

1.2 Objectives

The objectives of this LTEMP are to:

- Protect the health of site occupants, contractors and visitors from the residual environment hazards (specifically inclusive of asbestos) during the future operation of the City Park;
- Outline ongoing management requirements to ensure that the risk posed by environmentally impacted soils identified at the site (within the encapsulated area) is properly managed and maintained;
- Provide guidance on the responsibilities of maintaining the requirements of this LTEMP;
- Provide guidance on the appropriate control measures to be implemented in the event that the capping and/or marker layer requires to be breached; and
- Provide guidance on the appropriate procedures to manage works within environmentally impacted materials (specifically inclusive of asbestos as per requirements of the *Work Health and Safety Regulation* 2017).

It is expected that this LTEMP will be incorporated into the overall maintenance and environmental management procedures for the ongoing operation of the City Park.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2. Summary of Site Conditions

2.1 Site Details

The site location is shown on **Figure 1**. The extent of the City Park and associated cadastral boundaries are shown on **Figure 2**. The site details are summarised in **Table 2.1** and described in detail in the following sections.

Table 2.1: Summary Site Details

Property Identification and Street Addresses	The site is comprised of the following legal properties: • Lot 1 in DP 164798 and Lot 1 in DP 252457 – 134 to 138 Henry Street • Lot 10 and 11 in DP 553665 – 140 to 142 Henry Street • Lot 2 in DP 556075 – 144 Henry Street • Lot 3 in DP1200790 – 42 to 44 Station Street • Lot 1 in DP 526304 – 48 to 50 Station Street • Lot E in DP 163176 – 46 Station Street In addition, the site area includes portions of the Allen Place Car Park.
Local Government Authority	Penrith City Council
Approximate MGA Coordinates (MGA 56)	Easting: 286582.2 Northing: 6262912.7
Site Zoning	Commercial Core (B3) and Public Recreation (RE1) under Penrith Local Environmental Plan (LEP) 2010
Current Use	Commercial (car parking, retail and services)
Previous Use	Commercial/industrial (car parking, dry cleaning and general retail/services) and residential
Proposed Use	Public open space
Site Area	Approximately 0.71 ha

2.2 Site Description

The site is characterised as the area of encapsulated environmentally impacted soils within the extent of the City Park and consists of a range of soft and hard landscaped areas as intended to be used for a range of open space / recreational purposes. The impacted soils (the extent of the site) are retained in the western portion of the City Park at a distance of at least 30 m from any buildings / basements etc in proximity of the City Park. Reference can be made to survey plans provided as **Appendix A**.

2.3 Extent of Environmentally Impacted Material Remaining Onsite

Environmentally impacted material as affected with elevated levels of chlorinated ethenes and ACM has been retained in the western portion of the site. The containment is present over an area of 1300 m^2 and the impacted spoils are present from a depth of 1 m below the site surface to a maximum depth of 4 m bgs. The extent of the containment zone is shown on **Figure 2** and defined by surveys provided as **Appendix A**.

2.4 Summary of Identified Environmental Contamination Issues

Contaminated soils, inclusive of chlorinated ethenes and friable and non-friable asbestos remains in the ground beneath the capping and marker layer and needs to be managed.

2.4.1 Asbestos

Friable asbestos is defined in the Safe Work Australia *Code of Practice How to Manage and Control Asbestos in the Workplace* (SWA 2016a) as being *"…material that is in a powder form or that can be crumbled, pulverised or reduced to a powder by hand pressure when dry, and contains asbestos".*

Non-friable ACM is defined by SWA (2016a) as being *"…material containing asbestos that is not friable asbestos. Including materials containing asbestos fibres reinforced with a bonding compound"*.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Mechanical disturbance of ACM fragments and disturbance of soils may result in the release of fibres and therefore, such activities should be managed to prevent any fibres becoming airborne. Similarly the same activities can potentially give rise to release of soil particulates affected by chemical contaminants. The health effects of (specifically) asbestos are detailed in enHealth (2005) *Management of Asbestos in the Non-Occupational Environment*.

The primary issue associated with the asbestos remaining beneath the site capping and marker layer is managing the risk of inhalation of respirable fibres if the underlying asbestos impacted materials were to be disturbed. The primary issue of the potentially co-occurring chemical based contaminants is direct contact to the impacted soils and/or potential inhalation of impacted particulates generated from the soils and/or vapour intrusion from the impacted spoils to buildings / dwellings as constructed in proximity of the containment.

A secondary issue with the presence of the environmentally contaminated soils remaining at the site is disposal of excess spoil that may be impacted with chemical contaminants and/or asbestos in the event that excavation of materials beneath the capping and marker layer is required.

A description of the marker layer used to identify the boundary between the capping and potentially impacted materials is provided in **Section 2.5**. Management measures to deal with these materials in the event that it becomes necessary for the capping and marker layer to be breached are provided in **Section 4**.

2.4.2 Chlorinated Ethenes

Chlorinated ethene contamination in soils was found to pose a risk via vapour intrusion to potential future buildings constructed on the site and basements / existing buildings in proximity of the site. Potential human exposure may occur within existing / future buildings by inhalation of chlorinated ethene vapours caused to be present in the buildings / enclosed spaces by diffusive and advective processes. The containment area has been sufficiently separated from the location of existing buildings in proximity of the City Park to preclude the potential lateral migration of vapours to these buildings.

Chlorinated ethene impacted soils retained on other areas of the site are at insufficient levels to pose a potential risk to site users occupants in the future. This includes potential direct exposure of future excavation / maintenance workers to the impacted soils.

This validated condition needs to be maintained in the future by the retention of these soils in proximity of their current location and the exclusion of the construction of buildings overlying the retained soils. Potential recharge of surface water through the retained soils (by infiltration) requires to be minimised by the use of hardstand and a low permeability capping material.

The retained chlorinated ethene impacted soils can pose a potential ecological risk by leaching of the chlorinated ethene contaminant by infiltrating surface water / seepage water and migration of leachates to affect groundwater. Chlorinated ethene impacted groundwater can migrate to affect potentially sensitive ecological receptors in areas of groundwater discharge. Control of surface water infiltration through the retained chlorinated ethene impacted soils will control potential ecological risks.

The principal health risk associated with the chlorinated ethene impacted soils is potential volatilisation of the chlorinated ethene constituents and vapour movement into indoor buildings. Intruding vapours can be caused to accumulate within buildings which can pose a health risk to building occupants. Separation of the chlorinated ethene impacted soils from buildings / indoor spaces by at least 30 m will eliminate this potential.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2.5 Site Cover Layers

2.5.1 Requirements

The requirements for the capping and marker layers were specified in *Penrith City Council Penrith Central Park Village Remedial Work Plan 134-144 Henry Street, 42-50 Station Street, and Allen Place Car Park rev B*, 8 December 2020, JBS&G Australia Pty Ltd (JBS&G 2020). Distinct requirements have been provided for areas that are located in areas of surface hardstand, and areas that are in landscaped / non-paved areas of the PCVP. In summary in areas of hardstand, the requirements were:

- Placement of a visual marker layer overlying the environmentally impacted soils consisting of a bright orange coloured non-woven polyester continuous filament or PET (such as nonwoven geotextiles) or similar with a minimum density of approximately 150 grams per square metre (or equivalent); and
- Placement of a capping layer of at least 1.0 m of non-impacted soils overlying the marker layer and across the extent of impacted soils.

In areas of non-hardstand (i.e. landscaped / garden / grassed areas of the site), the requirements were:

- Placement of an initial low permeability material directly overlying the impacted soils. This has been nominated in JBS&G (2020) as consisting of a geosynthetic clay liner (GCL) with a hydraulic conductivity of less than 5×10^{-11} m/s (as consistent with the product specifications of Bentofix); and
- Placement of a visual marker layer directly overlying the GCL consisting of a bright orange coloured non-woven polyester continuous filament or PET (such as nonwoven geotextiles) or similar with a minimum density of approximately 150 grams per square metre (or equivalent); and
- Placement of a capping layer of at least 1.0 m of non-impacted soils overlying the marker layer and across the extent of impacted soils.

The physical capping is required to prevent ready access to soils contaminated with asbestos and other chemical contaminants. The physical barrier layer installed at the site is shown on the survey diagrams provided in **Appendix A**.

2.5.2 Extent of Marker Layers and Capping

The marker layer and capping is present overlying the extent of the contained impacted soils within the western portion of the PCVP. The precise extent is shown on **Appendix A**. Photographs of the installation of the low permeability liner, capping and marker layer are provided in **Appendix B**.

The extent of the containment within the western portion of the site is covered by a marker layer and capping (consisting of pavement or non-impacted soils), which must be maintained to prevent future site users, occupiers, visitors and contractors from being potentially exposed to the retained environmentally impacted soils. No dwellings / buildings may be constructed within 30 m of the extent of the containment.

Providing the marker layer and capping are maintained and control measures herein are successfully implemented in accordance with this LTEMP, there will be no health risks associated with contaminated soils remaining on the site, since there will be no direct pathways for site occupants to be exposed to the retained contamination.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Application and Enforcement of LTEMP and Responsibilities

3.1 Application of LTEMP

This LTEMP will apply indefinitely for future site operations.

The requirements of this LTEMP are intended to apply to any routine activities within the site which could involve disturbance or exposure of retained contaminated soil beneath the capping and marker layer but not limited to:

- Underground utility installation, maintenance or removal; or
- Excavations (e.g., dug, cut, piled or bored).

It is not intended that the LTEMP apply to major excavations, earthworks or construction activities. A specific management plan should be prepared if major works are proposed within the area of the encapsulated contaminated soils.

Section 4.2 provides requirements for shallow and deep intrusive works, however, disturbance of the marker layer should be avoided, if possible. As noted in **Section 4.2.2**, approval for deep intrusive works must be sought from the person/s with management or control of the workplace who is responsible for the enforcement of the LTEMP (**Section 3.3**). The person responsible for enforcement of the LTEMP will assess whether the works are necessary or if there is an alternative that will not result in exposure of environmentally impacted soil.

3.2 Site Owner

It is the responsibility of the Site Owner to ensure that:

- A copy of this LTEMP must be provided to all persons acquiring ownership of all or part of the site (Site Owners).
- A site owner must provide a copy of this LTEMP to any successor in Title.
- A site owner must ensure that a copy of this LTEMP is provided to all persons with management or control of a workplace at the site.
- A person/s with management or control of the workplace (specifically referred to the area of encapsulated contaminated soils) is made responsible for the implementation and maintenance of the provisions of this LTEMP.
- A person in a senior management position in the organisation is appointed as Site Environmental Manager and given the responsibility for ensuring the maintenance of the provisions of this LTEMP. The Site Environmental Manager may appoint appropriate personnel to implement the LTEMP day to day but will remain the responsible manager to whom the appointed personnel must report.
- Site personnel or contractors that must conduct intrusive works at the site are inducted into the LTEMP and are aware of their responsibilities with regard to health and safety and protection of the environment.
- A copy of this LTEMP is supplied to anyone conducting intrusive works on the site.
- The integrity of the marker layer and capping and/or hardstand / GCL liners is maintained by application of the procedures outlined in this LTEMP.
- The health and safety and environmental requirements specific to the contamination issues on the site, as outlined in this LTEMP, are complied with.
- Environmental incidents are reported in a timely manner to the appropriate statutory authorities, as necessary in accordance with legislation.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.3 Persons with Management or Control of the Workplace

The person/s with management or control of the workplace shall be responsible for the implementation and maintenance of the provisions of this LTEMP for the area of encapsulated contaminated soils.

Specifically, the persons/s with management or control of the workplace shall be responsible for:

- Ensuring the required routine inspections of the encapsulated area are completed and accurate records maintained;
- Organising appropriate works in the event that unexpected breaches of the capping and/or marker layers are encountered;
- Inducting relevant personnel, contractors and visitors into the requirements of this LTEMP. Detailed records of personnel inducted into the conditions of this LTEMP shall be kept (**Appendix C**);
- Ensuring any personnel or engaged contractors undertaking work that penetrates the depth of the capping and marker layer are aware of their responsibilities in relation to the encapsulated chemical-based contaminants potentially present and friable asbestos impacted materials known to be present;
- Ensuring any disturbance to the capping and marker layer are appropriately reinstated in accordance with the requirements of this LTEMP; and
- Documenting and updating records to reflect any works completed within the encapsulated area that may have extended below the depth of the capping and/or marker layer (**Appendix E**).

3.4 Summary of Provisions of this LTEMP

The provisions of this LTEMP are summarised as follows:

- Site personnel or contractors required to conduct intrusive works at the site must be inducted into the LTEMP and must be aware of their responsibilities with regard to health and safety and protection of the environment;
- A copy of this LTEMP is to be supplied to all persons conducting intrusive works on the site;
- The integrity of the capping and marker layers must be maintained by application of the procedures outlined in this LTEMP; and
- The health and safety and environmental requirements specific to the potential chemical constituent and friable asbestos hazards within the encapsulated area as outlined in this LTEMP must be complied with.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Contaminated Soil and Asbestos Management Strategy

It is expected that this LTEMP will be incorporated into the overall maintenance and environmental management procedures for all workplaces at the site.

4.1 General

The management procedures provided in the following sections have been primarily based on control of potential hazards that occur from asbestos contaminated soils / asbestos hazards. The nature of the potential co-occurring chemical hazards is that management procedures as designed for asbestos hazards will be sufficient to control potential risks as will occur with potential co-occurring chemical hazards (typically including chlorinated ethenes).

4.2 Potential Future Earthworks

The management procedures (provided in the following sections) are to be implemented during all routine intrusive works at the site including any potential future small-scale earthworks on the site (e.g. excavation for service installation or maintenance, tree planting). Major works within the area will require specific management controls.

There are two types of intrusions that may be undertaken at the site that would require management:

- Disturbance of the capping soils (shallow intrusive works); or
- Breach of the marker layer generally comprising excavations undertaken beyond a depth of 1 m below the ground surface.

Because activities breaching the marker layer entail greater risk than activities that simply disturb the upper depth of capping soils, different procedures apply to shallow and deep intrusive works, as outlined in the following sections.

4.2.1 Shallow Intrusive Works

These provisions for shallow intrusive works apply to works above the marker layer (i.e. works within the capping soils).

Where shallow intrusive works are required, the following management measures will apply:

- Approval for the works must be sought from the person/s with management or control of the workplace who is responsible for the enforcement of this LTEMP. A standing / long-term approval would be appropriate for persons engaged as gardeners / maintenance workers within the site;
- Site personnel or contractors required to conduct intrusive works at the site must be inducted into the LTEMP and must be aware of their responsibilities with regard to health and safety.
- A copy of this LTEMP is to be supplied to all persons conducting intrusive works on the site.
- Workers are not required to wear additional personal protective equipment (PPE) beyond normal site requirements for shallow intrusive works.
- Air monitoring is not required provided the environmentally impacted material beneath the marker layer is not disturbed.
- The marker layer shall not be disturbed, and any capping materials disturbed should be reinstated consistent with the description in **Section 2.5.2** of this LTEMP. Where disturbed, the capping materials should be separately stockpiled, managed and reinstated consistent

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

with this LTEMP (as applicable and appropriate). This shall include re-instatement of any areas of hardstand where hardstand is required to be removed.

- Any repairs to the capping and/or pavement (i.e. hardstand) overlying the marker layer shall be recorded as outlined in **Section 4.7** and changes should be detailed in an updated survey plan **(Appendix A)**, if required.

4.2.2 Deep Intrusive Works

These provisions for deep intrusive works apply to works that will extend below the marker layer (i.e. within encapsulated environmentally impacted materials). This is below the capping soils and marker layer in the site areas underlying paved / hardstand areas, or otherwise underlying the capping layer, marker layer and GCL in non-paved / landscaped / gardens areas of the site.

Where deep intrusive works are required, the following management measures will apply:

- Prior to any deep intrusive work commencing, approval for the works must be sought from the person/s with management or control of the workplace who is responsible for the enforcement of the LTEMP (**Section 3**) who will assess whether the works are necessary or if there is an alternative that will not result in exposure of environmentally impacted soil and whether the works are required to be carried out by a specialist contractor. The person/s with management or control of the workplace must also review and approve the Job Safety Risk Assessment (JSRA) and Safe Work Method Statement (SWMS) for the works and ensure that site personnel and/or contractors who will undertake the works understand the requirements of the LTEMP.
- Site personnel or contractors required to conduct deep intrusive works at the site must be inducted into the LTEMP and must be aware of their responsibilities with regard to health and safety, including those noted in **Section 4.3** following.
- A copy of this LTEMP is to be supplied to all persons conducting deep intrusive works on the site.
- The works area must be isolated from casual entry using temporary barriers and only personnel inducted in the requirements of the site LTEMP will be permitted to enter the works area.
- Sufficient space must be provided within the works area to allow stockpiling of spoil from excavations, if required, in accordance with **Section 4.4**.
- In the event that materials from under the marker layer must be excavated, a water supply must be provided to the works area for the purpose of maintaining potential environmentally impacted soil in the excavations and stockpiles in a moist state.
- Personnel entering the works area must wear appropriate PPE in accordance with **Section 4.3.**
- Decontamination procedures must be undertaken in accordance with **Section 4.3**.
- Stockpiles of excavated spoil must be managed in accordance with **Section 4.4**.
- Air monitoring to be undertaken in accordance with **Section 4.3**.
- Once the works are complete, the capping and marker layer shall be reinstated with materials of similar nature as were originally present, as described in this LTEMP. Where materials are imported for use in the capping layer, if required, they must be validated as suitable for the site use. In the case that the works were undertaken in an area of landscaping / garden and the GCL was removed, new replacement GCL shall be re-installed

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

with the reinstatement of the excavation at the same depth at which the original was removed. The removed (existing) GCL must not be re-used and must be disposed of.

- Areas of removal of hardstand / paving must be replaced with hardstand / paving in the reinstatement of the site.
- Any repairs to the capping and/or pavement shall be recorded as outlined in **Section 4.8** and changes should be detailed in an updated survey plan **(Appendix A)**, if required.

4.2.3 Reinstatement of Capping

Following potential works as completed as per **Section 4.2.1** or **4.2.2**, there may be a requirement to supply new 'capping material' to the site to replace existing capping material as consumed by the works. Capping material is to consist of virgin excavated natural material (VENM) or excavated natural material (ENM) and pavement or a GCL meeting the requirements of **Section 2.5.1** where observed to be removed during the works.

Where pavement is used a minimum thickness of 50 mm is required.

Where VENM or ENM are used, then appropriate validation assessment, inclusive sampling and analysis must be available as consistent with relevant NSW EPA guidelines or otherwise resource recovery exemptions. The person responsible for the implementation of the LTEMP must be provided with all relevant copies of documentation certifying the suitability of capping material.

4.3 Specific Requirements for Those Working with Asbestos Impacted Material

Asbestos-containing materials are present and friable asbestos is known to be present in soil underlying the marker layer. Work involving any breaches of the capping and marker layer, (i.e. deep intrusive works exceeding a depth of 1.0 m) will require supervision by a Class A licensed asbestos contractor. The works will be undertaken using the procedures described in the SWA *Code of Practice How To Safely Remove Asbestos (SWA 2016b)* and the following site-specific procedures:

- All site workers shall be inducted to the site and made aware of the procedures outlined in this LTEMP.
- Workers and visitors to the site area will be made aware of the friable asbestos contamination during site inductions and tool box meetings and only authorised people shall enter the work area, which must contain a perimeter barrier to restrict entry.
- An asbestos work area shall be defined and clearly marked.
- All personnel working within the asbestos work area shall wear P2 (or higher) class half face respirators, disposable gloves and coveralls made from materials which provide adequate protection against fibre penetration whilst completing works and whilst within the asbestos work area.
- A 10 m wide exclusion zone shall be established around the perimeter of the asbestos work area. The dimensions of the exclusion zone may be varied by the person/s with management or control of the workplace, or by the Class A licensed asbestos contractor, if necessary to ensure the day to day operation of the City Park or otherwise significant infrastructure.
- Asbestos warning signs shall be placed surrounding the asbestos work area and at entry/egress points.
- A decontamination area shall be marked out within the asbestos work area for the removal and disposal of PPE before site workers leave the asbestos work area. Personal decontamination must be undertaken each time a site worker leaves the asbestos works

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

area and at the completion of the works. All disposable PPE shall be disposed of as asbestos waste.

- Static air monitoring at a minimum of four locations surrounding each asbestos work area and with consideration to neighbouring receptors shall be undertaken in accordance with the *Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres 2nd Edition* [NOHSC: 3003(2005)] for the duration of the work. The monitoring locations shall be assigned by a Licensed Asbestos Assessor (LAA).
- At the completion of the works the capping and marker layer are to be re-instated in accordance with the requirements of this LTEMP. The changes should be detailed in an updated register of site works as included as **Appendix E.**

4.4 Soil Management

Any environmentally impacted soil/fill (including asbestos impacted materials and further inclusive of areas of GCL as removed by excavation works) excavated during deep intrusive works must be securely stockpiled separately from the capping / marker layer material. Capping and marker layer materials should also be separately stockpiled. Stockpiles must be placed on a sealed surface or on plastic sheeting to prevent cross contamination of unsealed surfaces.

Stockpiles must be placed in a secure location onsite and covered if they are to remain for more than 24 hours.

Spoil generated from on-site excavations may be re-used on-site, noting that any material excavated from below the marker layer must be re-used below the marker layer. Capping material cross contaminated with soil from below the marker layer must be re-used below the marker layer.

Alternatively, excavated environmentally impacted soils / materials shall be disposed off-site following appropriate waste classification in accordance with **Section 4.6**.

4.5 Dust Management

During any deep intrusive works that will penetrate the marker layer, excavations and stockpiles of spoil should be kept damp to prevent the generation of dust from these sources. Care should be taken to not over-wet excavations and/or stockpiles such that excess runoff is generated.

4.6 Off-Site Disposal and Waste Management

If any material is to be excavated for off-site disposal it should be classified in accordance with EPA waste classification guidelines (NSW EPA 2014[1]) or guidelines that may be in force at that time. Waste must be managed in accordance with the provisions of the *Protection of the Environment Operations (Waste) Regulation 2014* or successor instruments.

[1] Waste Classification Guidelines, Part 1: Classifying Waste, NSW Environment Protection Authority, November 2014 (EPA 2014)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4.7 Emergency Preparedness and Response

The following procedure will be followed in the event that the capping and marker layer are breached unintentionally such that the underlying environmentally impacted soil is exposed:

- Stop the activity or process that has exposed the impacted soil;
- Assess the hazards associated with the exposure of the impacted material and implement appropriate procedures to address the hazards;
- Repair the capping and marker layers such that the impacted soil is once again isolated beneath the capping / barrier. This shall include replacement of the GCL where the original GCL was caused to be removed;
- Collect and secure any impacted soil that may remain exposed and stockpile securely so that it is protected from casual access;
- Review the activity or process that led to the exposure of the impacted soil and revise procedures or actions accordingly to prevent a reoccurrence;
- Complete an environmental incident/corrective action report in accordance with the current quality procedure; and
- Review and revise the LTEMP to reflect any changes that have to be made to prevent a reoccurrence.

In the event of an emergency, then the following persons / organisations shall be available to provide assistance.

Table 4.1: Emergency Contacts

Person	Organisation	Role	Contact Details

4.8 Building / Dwelling Controls

No buildings / dwellings / indoor spaces as potentially affected by restricted ventilation are to be built within the extent of the site (the extent of encapsulated soils) or otherwise within 30 m of the extent of the encapsulated soils. Reference should be made to **Appendix A** for the surveyed extent of the retained soils.

4.9 Capping Inspections

Routine inspection of the capping integrity shall be conducted at the following times throughout the future operation of the site (**Table 4.2**).

Table 4.2: Capping Inspections

Inspection Time	Inspection Frequency
Following an accidental breach/penetration of the capping or marker layer	Following incident
Following break / repair of capping and/or pavement underlying rail lines	Upon completion
Routine inspection of capping across site	Annually

Records of the inspection shall be retained for a minimum period of four years (**Appendix E**).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5. Health and Safety Management

It is the responsibility of persons with management or control of workplaces at the site to ensure that comprehensive health and safety programmes that comply with the requirements of the WHS Regulation and are appropriate for the activities undertaken at the site are implemented. Given the presence of asbestos at the site, additional protocols and procedures that address the specific hazards posed by the asbestos must be included in the overall health and safety plans implemented.

The only significant exposure pathway that can lead to health effects from asbestos fibres is inhalation of respirable fibres. Consequently, workers who may be exposed to dust that has the potential to contain asbestos fibres must wear appropriate respiratory protection. Furthermore, measures must be taken to ensure that dust or other material that may contain asbestos fibres is not carried out of the work area to areas where breathing protection would not ordinarily be considered a requirement.

Potential risks to other co-occurring contaminants can be similarly managed by precluding the potential exposure of the impacted materials or direct contact to the impacted soils otherwise. And to adopt the additional control as noted in **Section 4.8** to eliminate the potential of vapour intrusion / accumulation within site dwellings. The measures as implemented to control potential asbestos hazards will be similarly effective to control risks from other chemical contaminants as may potentially be present.

With regard to the site, there is a risk that soil underlying the capping and marker layer may release asbestos fibres if disturbed. Consequently, in areas where intrusive works are expected to breach the capping and marker layer, work should be supervised by a person holding a Class A licence who should prepare Job Safety Risk Assessments (JSRA) and Safe Work Method Statements (SWMS) relating to the potential for asbestos to be present. The JSRA and SWMS should be submitted to the Responsible Person, who should ensure that the intrusive works are carried out in accordance with the JSRAs and SWMS and requirements identified in **Sections 3 and 4** of this LTEMP.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6. Revision of the LTEMP

It may, from time to time, be necessary to revise this LTEMP to reflect changes to legislation, changes on site and/or improvements in technologies or knowledge.

Revision of the LTEMP should be undertaken by an appropriately qualified and experienced environmental consultant or Occupational Hygienist. Any amendments to the LTEMP will need to be reviewed by the Auditor. Copies of the revised LTEMP should be distributed to the current site owners, person/s with management or control of the workplace and regular site workers for on-going implementation.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquires.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

Version: 1, Version Date: 14/04/2021

NSW Site Auditor Scheme

Site Audit Statement

A site audit statement summarises the findings of a site audit. For full details of the site auditor's findings, evaluations and conclusions, refer to the associated site audit report.

This form was approved under the *Contaminated Land Management Act 1997* on 12 October 2017.

For information about completing this form, go to Part IV.

Part I: Site audit identification

Site audit statement no. SAS116

This site audit is a:

☐ ~~statutory audit~~

☑ non-statutory audit

within the meaning of the *Contaminated Land Management Act 1997*.

Site auditor details

(As accredited under the *Contaminated Land Management Act 1997*)

Name	Rebeka Hall
Company	Zoic Environmental Pty Ltd
Address	Suite 1, Level 9, 189 Kent St SYDNEY NSW
	Postcode 2000
Phone	02 9251 8070

Nature of statutory requirements (not applicable for non-statutory audits)

☐ ~~Requirements under the *Contaminated Land Management Act* 1997 (e.g. management order; please specify, including date of issue)~~

☐ ~~Requirements imposed by an environmental planning instrument (please specify, including date of issue)~~

☐ ~~Development consent requirements under the *Environmental Planning and Assessment Act 1979* (please specify consent authority and date of issue)~~

☐ ~~Requirements under other legislation (please specify, including date of issue)~~

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Purpose of site audit

☐ **A1** To determine land use suitability

Intended uses of the land:

OR

A2 To determine land use suitability subject to compliance with either an active or passive environmental management plan

Intended uses of the land:

OR

(Tick all that apply)

☐ **B1** To determine the nature and extent of contamination

☑ **B2** To determine the appropriateness of:

☐ an investigation plan

☑ a remediation plan

☐ a management plan

☐ **B3** To determine the appropriateness of a **site testing plan** to determine if groundwater is safe and suitable for its intended use as required by the *Temporary Water Restrictions Order for the Botany Sands Groundwater Resource 2017*

☐ **B4** To determine the compliance with an approved:

☐ **voluntary management proposal** or

☐ **management order** under the *Contaminated Land Management Act 1997*

☑ **B5** To determine if the land can be made suitable for a particular use (or uses) if the site is remediated or managed in accordance with a specified plan.

Intended uses of the land: Public Park (western portion of site), high density residential apartments and commercial/industrial buildings with a 2 level basement car parking (eastern portion of site), based on conceptual plan as attached to the SAS.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Part II: Auditor's findings

Please complete either Section A1, Section A2 or Section B, not more than one section. (Strike out the irrelevant sections.)

- Use **Section A1** where site investigation and/or remediation has been completed and a conclusion can be drawn on the suitability of land uses **without the implementation** of an environmental management plan.
- Use **Section A2** where site investigation and/or remediation has been completed and a conclusion can be drawn on the suitability of land uses **with the implementation** of an active or passive environmental management plan.
- Use **Section B** where the audit is to determine:
    - (B1) the nature and extent of contamination, and/or
    - (B2) the appropriateness of an investigation, remediation or management plan[1], and/or
    - (B3) the appropriateness of a site testing plan in accordance with the *Temporary Water Restrictions Order for the Botany Sands Groundwater Source 2017*, and/or
    - (B4) whether the terms of the approved voluntary management proposal or management order have been complied with, and/or
    - (B5) whether the site can be made suitable for a specified land use (or uses) if the site is remediated or managed in accordance with the implementation of a specified plan.

[1] For simplicity, this statement uses the term 'plan' to refer to both plans and reports.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Section A1

I certify that, in my opinion:

The **site is suitable** for the following uses:

(Tick all appropriate uses and strike out those not applicable.)

☐ Residential, including substantial vegetable garden and poultry

☐ Residential, including substantial vegetable garden, excluding poultry

☐ Residential with accessible soil, including garden (minimal home-grown produce contributing less than 10% fruit and vegetable intake), excluding poultry

☐ Day care centre, preschool, primary school

☐ Residential with minimal opportunity for soil access, including units

☐ Secondary school

☐ Park, recreational open space, playing field

☐ Commercial/industrial

☐ Other (please specify):

_____

OR

☐ I certify that, in my opinion, the **site is not suitable** for any use due to the risk of harm from contamination.

~~Purpose of the EMP:~~

~~Description of the nature of the residual contamination:~~

~~Summary of the actions required by the EMP:~~

~~How the EMP can reasonably be made to be legally enforceable:~~

~~How there will be appropriate public notification:~~

~~Overall comments:~~

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Section B

Purpose of the plan[4] which is the subject of this audit:

The overarching RAP (JBS& G, 5 March 2019) presents strategies and remedial options to address the identified environmental impact and to render the site suitable for the proposed uses.

The objectives of this RAP are to:

- Provide a summary of historical site assessments and present a conceptual site model (CSM) documenting the known extent of environmental impact at the site and key exposure pathways associated with the proposed development;
- Identify outstanding potential contamination issues which require further assessment prior to the development and implementation of detailed site-specific RWPs;
- Identify the remedial strategy(ies) to be adopted by an assessment of remedial options considering the proposed land use
- Document the procedures and standards to be followed in order to remove the risks posed by contaminated soils, soil vapour and groundwater to make the site suitable for the proposed developme-nt, while ensuring the protection of human health and the surrounding environment.

I certify that, in my opinion:

~~(B1)~~

☐ ~~The nature and extent of the contamination **has** been appropriately determined~~

☐ ~~The nature and extent of the contamination **has not** been appropriately determined~~

AND/OR (B2)

☑ The investigation, remediation or management plan **is** appropriate for the purpose stated above

☐ ~~The investigation, remediation or management plan **is not** appropriate for the purpose stated above~~

~~AND/OR (B3)~~

☐ ~~The site testing plan:~~

☐ ~~**is** appropriate to determine~~

☐ ~~**is not** appropriate to determine~~

~~if groundwater is safe and suitable for its intended use as required by the *Temporary Water Restrictions Order for the Botany Sands Groundwater Resource 2017*~~

~~AND/OR (B4)~~

☐ ~~The terms of the approved voluntary management proposal* or management order** (strike out as appropriate):~~

[4] For simplicity, this statement uses the term 'plan' to refer to both plans and reports.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

~~☐ **have** been complied with~~

~~☐ **have not** been complied with.~~

~~*voluntary management proposal no.~~

~~**management order no.~~

AND/OR (B5)

☑ The site **can be made suitable** for the following uses:

(Tick all appropriate uses and strike out those not applicable.)

~~☐ Residential, including substantial vegetable garden and poultry~~

~~☐ Residential, including substantial vegetable garden, excluding poultry~~

~~☐ Residential with accessible soil, including garden (minimal home-grown produce contributing less than 10% fruit and vegetable intake), excluding poultry~~

~~☐ Day care centre, preschool, primary school~~

☑ Residential with minimal opportunity for soil access, including units

~~☐ Secondary school~~

☑ Park, recreational open space, playing field

☑ Commercial/industrial

~~☐ Other (please specify):~~

If the site is remediated~~/managed*~~ in accordance with the following plan (**attached**):

*Strike out as appropriate

Plan title: Penrith Central Park Village Overarching Remedial Action Plan 114 to 146 Henry Street, 42 to 50 Station Street, and Allen Place Car Park (Ref: 55073/120362 Rev 0)

Plan author JBS&G

Plan date 5 March 2019 No. of pages 124

SUBJECT to compliance with the following condition(s):

1. Data gaps and the closure of unknowns, as described in Section 6.7 and 6.2.3 respectively, as outlined in the JBS&G (5 March 2019) RAP are to be completed as part of early remediation works. Depending on the findings of the additional works, the RAP should be reviewed and amended should contamination be greater than anticipated, if the risk profile for the site changes or if the remedial strategy differs to that outlined in the current RAP.
2. Pre-demolition hazardous material assessment is to be completed prior to demolition of existing buildings.
3. Preparation of site specific Remedial Work Plans (RWP) if remedial works are staged and the soil vapour SAQP for validation of VOC contamination in the vicinity of the former dry cleaner, should be provided to the Auditor for review and endorsement..

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Should UPSS and associated infrastructure be encountered at the former service station property (currently occupied by the Rivers retail store), groundwater validation is required to comply with the NSW UPSS Regulation 2008.
5. Future works should address any EPA requirements in regard to further offsite delineation of the chlorinated hydrocarbon groundwater or soil vapour plume if the EPA deems contamination to be significant.
6. A review of potential restriction to beneficial use of groundwater is to be completed post-remediation.
7. Interim environmental monitoring is to be carried out as described in the JBS&G (5 March 2019) interim Environmental Monitoring Plan for Shop 3, 140 Henry Street as per the stated frequency up until demolition and remediation of the site commences to ensure no unacceptable exposure to contaminants of concern within indoor air occur.

Overall comments:

Note: The above land uses are based on the current conceptual development plan as attached to the SAS. Should more sensitive land uses be proposed or change in landuse configuration the environmental data should be reassessed and the endorsed RAP updated as appropriate.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Part III: Auditor's declaration

I am accredited as a site auditor by the NSW Environment Protection Authority (EPA) under the *Contaminated Land Management Act 1997.*

Accreditation no. 0802

I certify that:

- I have completed the site audit free of any conflicts of interest as defined in the *Contaminated Land Management Act 1997,* and
- with due regard to relevant laws and guidelines, I have examined and am familiar with the reports and information referred to in Part I of this site audit, and
- on the basis of inquiries I have made of those individuals immediately responsible for making those reports and obtaining the information referred to in this statement, those reports and that information are, to the best of my knowledge, true, accurate and complete, and
- this statement is, to the best of my knowledge, true, accurate and complete.

I am aware that there are penalties under the *Contaminated Land Management Act 1997* for wilfully making false or misleading statements.

Signed

Date 18 April 2019

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Part IV: Explanatory notes

To be complete, a site audit statement form must be issued with all four parts.

How to complete this form

Part I

Part I identifies the auditor, the site, the purpose of the audit and the information used by the auditor in making the site audit findings.

Part II

Part II contains the auditor's opinion of the suitability of the site for specified uses or of the appropriateness of an investigation, or remediation plan or management plan which may enable a particular use. It sets out succinct and definitive information to assist decision-making about the use or uses of the site or a plan or proposal to manage or remediate the site.

The auditor is to complete either Section A1 or Section A2 or Section B of Part II, **not** more than one section.

Section A1

In Section A1 the auditor may conclude that the land is *suitable* for a specified use or uses OR *not suitable* for any beneficial use due to the risk of harm from contamination.

By certifying that the site is *suitable*, an auditor declares that, at the time of completion of the site audit, no further investigation or remediation or management of the site was needed to render the site fit for the specified use(s). **Conditions must not be** imposed on a Section A1 site audit statement. Auditors may include **comments** which are key observations in light of the audit which are not directly related to the suitability of the site for the use(s). These observations may cover aspects relating to the broader environmental context to aid decision-making in relation to the site.

Section A2

In Section A2 the auditor may conclude that the land is *suitable* for a specified use(s) subject to a condition for implementation of an environmental management plan (EMP).

Environmental management plan

Within the context of contaminated sites management, an EMP (sometimes also called a 'site management plan') means a plan which addresses the integration of environmental mitigation and monitoring measures for soil, groundwater and/or hazardous ground gases throughout an existing or proposed land use. An EMP succinctly describes the nature and location of contamination remaining on site and states what the objectives of the plan are, how contaminants will be managed, who will be responsible for the plan's implementation and over what time frame actions specified in the plan will take place.

By certifying that the site is suitable subject to implementation of an EMP, an auditor declares that, at the time of completion of the site audit, there was sufficient information satisfying guidelines made or approved under the *Contaminated Land Management Act 1997*

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

(CLM Act) to determine that implementation of the EMP was feasible and would enable the specified use(s) of the site and no further investigation or remediation of the site was needed to render the site fit for the specified use(s).

Implementation of an EMP is required to ensure the site remains suitable for the specified use(s). The plan should be legally enforceable: for example, a requirement of a notice under the CLM Act or a development consent condition issued by a planning authority. There should also be appropriate public notification of the plan, e.g. on a certificate issued under s.149 of *the Environmental Planning and Assessment Act 1979*.

Active or passive control systems

Auditors must specify whether the EMP requires operation and/or maintenance of active control systems or requires maintenance of passive control systems only. Active management systems usually incorporate mechanical components and/or require monitoring and, because of this, regular maintenance and inspection are necessary. Most active management systems are applied at sites where if the systems are not implemented an unacceptable risk may occur. Passive management systems usually require minimal management and maintenance and do not usually incorporate mechanical components.

Auditor's comments

Auditors may also include **comments** which are key observations in light of the audit which are not directly related to the suitability of the site for the use(s). These observations may cover aspects relating to the broader environmental context to aid decision-making in relation to the site.

Section B

In Section B the auditor draws conclusions on the nature and extent of contamination, and/or suitability of plans relating to the investigation, remediation or management of the land, and/or the appropriateness of a site testing plan in accordance with the *Temporary Water Restrictions Order for the Botany Sands Groundwater Source 2017*, and/or whether the terms of an approved voluntary management proposal or management order made under the CLM Act have been complied with, and/or whether the site can be made suitable for a specified land use or uses if the site is remediated or managed in accordance with the implementation of a specified plan.

By certifying that a site *can be made suitable* for a use or uses if remediated or managed in accordance with a specified plan, the auditor declares that, at the time the audit was completed, there was sufficient information satisfying guidelines made or approved under the CLM Act to determine that implementation of the plan was feasible and would enable the specified use(s) of the site in the future.

For a site that *can be made suitable*, any **conditions** specified by the auditor in Section B should be limited to minor modifications or additions to the specified plan. However, if the auditor considers that further audits of the site (e.g. to validate remediation) are required, the auditor must note this as a condition in the site audit statement. The condition must not specify an individual auditor, only that further audits are required.

Auditors may also include **comments** which are observations in light of the audit which provide a more complete understanding of the environmental context to aid decision-making in relation to the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Part III

In **Part III** the auditor certifies their standing as an accredited auditor under the CLM Act and makes other relevant declarations.

Where to send completed forms

In addition to furnishing a copy of the audit statement to the person(s) who commissioned the site audit, statutory site audit statements must be sent to

- the **NSW Environment Protection Authority**: nswauditors@epa.nsw.gov.au or as specified by the EPA

  AND

- the **local council** for the land which is the subject of the audit.

1. Introduction

1.1 Introduction and Background

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (Penrith, the client) to provide environmental consultancy services associated with the proposed redevelopment of the Penrith City Village Park (PCPV, the site) (**Figure 1**). The site comprises ten (10) legal properties over an approximate area of 1.87 hectares (ha) bound by Station Street, Henry Street, Allen Place and Woodriff Street North, as shown on **Figure 1** and **Figure 2**. The address and legal identification of each property are provided in **Table 3.1**.

The site is currently zoned 'Commercial Core (B3)' and 'Public Recreation (RE1)' (Penrith 2010[1]) and is proposed to be developed for mixed uses including recreational areas and 4 to 6 storey residential apartments with ground floor retail/commercial uses and potential multi-level basements. As part of the rezoning process for the site council requires (in accordance with SEPP55) that it is demonstrated that the site is suitable (or can be made suitable) for the proposed land use.

To facilitate feasibility planning and costing, Council has engaged JBS&G to provide an overarching Remedial Action Plan (RAP), as documented herein. Upon development of detailed design plans, and establishment of project staging, detailed Remedial Works Plans (RWPs) can be prepared to facilitate staged remediation of the site. This RAP is for remediation of the PCPV site redevelopment. Should contamination present in offsite areas require remediation this will be subject to separate RAPs/RWPs.

The site has historically been used for a combination of residential and commercial land uses, including dry-cleaning and retail fuel dispensing, followed more recently by light commercial land uses (retail shops, restaurants, health/wellness services, tutoring services and a funeral parlour). Contamination investigations conducted at the site (Geo-Logix 2016[2], JBS&G 2017[3], JBS&G 2019a[4] and JBS&G (2019b[5]) have identified the presence of elevated volatile organic compounds (VOC) within site media surrounding the former dry-cleaner.

The RAP identifies strategies and remedial options to address the identified environmental impact and render the site suitable for the proposed land use. This RAP has been prepared with reference to relevant Australian Standards and guidelines made or approved by the NSW EPA.

5 *Basement Vapour Intrusion Assessment* – 121 Henry Street, Penrith, NSW. JBS&G Australia Pty Ltd dated 15 January 2019, Reference 55702-119862, JBS&G (2019b)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

1.2 Objective

The objectives of this RAP are to:

- Provide a summary of historical site assessments and present a conceptual site model (CSM) documenting the known extent of environmental impact at the site and key exposure pathways associated with the proposed development;
- Identify outstanding potential contamination issues which require further assessment prior to the development and implementation of detailed site-specific RWPs;
- Identify the remedial strategy(ies) to be adopted by an assessment of remedial options considering the proposed land use; and
- Document the procedures and standards to be followed in order to remove the risks posed by contaminated soils, soil vapour and groundwater to make the site suitable for the proposed development, while ensuring the protection of human health and the surrounding environment.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2. Proposed Development Concept

2.1 Background

Council has indicated that the site is to be redeveloped into a mixture of public open spaces, and six storey structures comprising a mixture of retail, restaurant, services, entertainment and cultural spaces. The PCPV area is intended to be highly accessible and includes internal shared paths/roads and pedestrian laneways. Preliminary conceptual plans (**Appendix A**) show the current and proposed land uses, the layout of new green spaces, development sites, laneways and pedestrian arcades.

The PCPV provides a range of open spaces including parks and facilities offering places for relaxation, recreation and opportunities for community interaction. The conceptual site layout is shown on **Figure 2**. Council envisages that the western site portion is to be redeveloped into a contemporary public space which creates a focal point for the City Centre and fosters social and economic growth. The balance of the site will comprise development sites to be utilised for residential apartments, laneways, minor green spaces and pedestrian arcades.

2.2 Building Development Area

Preliminary design plans (**Appendix A**) include a mixture of recreational use and 4 to 6 storey residential apartments within the building development area, occupying approximately 11 200 m^2 of the site (**Figure 2**). It is anticipated that bulk excavation to form basements may be required within this portion of the site. The basement is anticipated to occupy a footprint between 13 000 m^2 and 19 000 m^2 and comprise two basement levels. Future landscaped areas (paved extents and/or establishment of flora) within this portion of the site will likely be limited to shallow plantings within constructed garden beds. Laneways and shared paths within the building development area are anticipated to comprise a mixture of concrete, asphaltic and paved hardstands.

2.3 Penrith City Park

Review of the design plans indicate that the Penrith City Park component of the site will comprise a large (approximately 7500 m^2) open recreational space. The park is envisaged to comprise a mixture of paved and grassed areas including shallow/deep planted gardens and potentially raised garden boxes.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Site Condition and Surrounding Environment

3.1 Site Identification

The site location is shown on **Figure 1**. The extent of the site and associated cadastral boundaries are shown on **Figure 2**. The site details are summarised in **Table 3.1** and described in detail in the following sections.

Table 3.1 Summary Site Details

Property Identification and Street Addresses	The site is comprised of the following legal properties: • Lot 1 in DP 545587 – 114 to 116 Henry Street • Lot 1 in DP113118 – 118 to 120 Henry Street • Lot 1 in DP 254763 – Henry Street • Lot 1 in DP 164798 – 134 to 138 Henry Street • Lot 10 and 11 in DP 553665 – 142 Henry Street • Lot 2 in DP 556075 – 144 Henry Street • Lot 3 in DP1200790 – 42 to 44 Station Street • Lot 1 in DP 526304 – 48 to 50 Station Street • Lot E in DP 163176 – 46 Station Street In addition, the site area includes the Allen Place Car Park, Gaymark Lane and Allen Place.
Local Government Authority	Penrith City Council
Approximate MGA Coordinates (MGA 56)	As shown on **Figure 2**
Site Zoning	Commercial Core (B3) and Public Recreation (RE1), Penrith (2010)
Current Use	Commercial (car parking, retail, restaurant and services)
Previous Use	Commercial/industrial (car parking, dry cleaning, petroleum dispensing and general retail/services) and residential
Proposed Use	High density residential, public open space and commercial
Site Area	Approximately 1.87 ha

3.2 Site Description

The site was inspected by Rohan Hammond on 3 May 2018.

The site is an irregularly shaped, large commercial precinct bound by the Allen Place loop, Henry Street, Station Street and 98-100 Henry Street. The site area includes the Allen Place car park and ten commercial premises on the southern side of Henry Street in Penrith. The borders of the site were not secured and open to the public (pedestrians and vehicles). The site was utilised for a range of commercial operations at the time of the site investigation including a car park, retail shops and cafes. High pedestrian and vehicular traffic was observed during working hours. All commercial premises at the site were noted to be occupied.

The site generally sloped downward from east to west, with a slight ridge line observed to dissect the centre of the car park. Inspection of site surfaces and comparisons with the surrounding landscape indicated that significant topographical alterations had not occurred.

Approximately 95 % of the ground surfaces were sealed as asphaltic pavement, concrete pathways, and building footprints with onsite drainage channels directing surface water toward the municipal stormwater system. The balance of the site comprised unsealed grounds in the form of garden beds.

Buildings at the site did not exhibit significant indicators of dilapidation, although minor wear, consistent with the age of the buildings was observed. A detailed inspection/hazardous building materials survey of the existing site structures was not undertaken as part of this investigation.

No surface water was present at the site at the time of the investigation. No evidence of waste storage, except for commercial municipal waste bins, or storage tanks were observed at the site. No

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

olfactory indicators of volatile chemical usage, as described in the DSI, were encountered during the recent site inspection. No visual indicators of gross or widespread contamination were observed.

Four transformers were observed: one in the southwest and east corners of the site and two along the northern boundary of the Allen Place Car Park, which were on raised concrete platforms. No hydrocarbon staining was observed to be associated with the transformers. The location of the transformers is shown on **Figure 2.**

3.2.1 The Dry Cleaner, 134-138 Henry Street, Penrith

The former dry cleaner comprised the northern third of the building located at 134-138 Henry Street, Penrith. The shop-front occupied most of the building footprint (>85 %), with the remainder comprising a secluded water closet, storage space and point of sale. The premise was an operational scooter store, occupied by scooters, bikes, helmets and related paraphernalia.

The water closet comprised a small (<3 m^2), fully enclosed space which was serviced by two separate sewerage disposal points. Detergents, household solvents and soaps were observed to be stored within the water closet. The shop-front was serviced by an air exchange (air-conditioning) unit which was observed to be operational during each visit to the premises.

In the alleyway between The Dry Cleaner and Shop 3, numerous services were present. Sewerage infrastructure and stormwater pipes ran in a north to south orientation, connecting stormwater and sewerage pipes to the greater system, south of the premises. Services were noted to comprise a mixture of terracotta and polyvinyl chloride (PVC) pipes.

3.2.2 Shop 3, 140 Henry Street, Penrith

Shop 3 comprised the southern half of the building located at 140 Henry Street, Penrith. The shop was partitioned into four rooms and a water closet, joined by a central hallway. The premises housed an alternative health centre at the time of the investigation.

The shop-front rooms were serviced by air exchange units (air conditioners) which were observed to be in operation during each site visit. The water closet comprised a small (<5 m^2), fully enclosed space which was serviced by two separate sewerage disposal points.

An inspection of the property revealed the presence of household cleaning and medical products: limescale solvents, surface cleaners, stain removers, methylated spirits, polishes, pest control products, ethanol based surface wipes and carpet deodorizers.

3.3 Surrounding Land Use

The current land uses of adjacent properties or properties across adjacent roads are summarised below.

- North – The site is bound to the north by Henry Street and then numerous commercial premises including UFC Gym, Queens of Hearts Community Foundation and Nepean College. Further north is an open carpark and commercial premises on Belmore Street, including Bob Jane T-Marts and Veterinary Hospital;
- East – To the east of the site is Woodriff Street North, followed by commercial premises and Edwards Place carpark. Further east a Pathology Centre and testing laboratory are present;
- South – The is was bound to the south by Allen Place, following which are multiple commercial properties including cafes, a medical centre and pharmacy. Beyond High Street commercial premises are present; and
- West – The site is bound to the west by Station Street, then medium to high density commercial premises. Further to the west is Peach Tree Creek and eventually the Nepean River.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.4 Topography

Review of topographic information obtained from the Spatial Information Exchange Viewer, LPI (2015[6]) regional topographic map indicated that the site surfaces have an elevation of approximately 30 m Australian Height Datum (AHD). The site generally slopes downwards to the west, towards the Nepean River.

Site inspection confirmed that the topography on site was not significantly altered from the natural alignment and sloped slightly downward toward the western boundary, Station Street. A local ridge line existed which dissected the Allen Place Car Park in an approximately west to east alignment, with site surfaces sloping downwards perpendicular to the ridge line.

3.5 Geology and Soils

Reference to the 1:100 000 Geological Series Sheet for Penrith, DMR (1991[7]) indicates that the site is underlain by Bringelly Shale of the Wianamatta Group originating from the Middle Triassic epoch. This unit is comprised of shale, carbonaceous claystone, claystone, laminite, fine to medium-grained lithic sandstone, rare coal and tuff. Bringelly Shale is underlain by Ashfield Shale and, at depth, Hawkesbury Sandstone.

Reference to the 1:100 000 Soil Landscape Series Sheet for Penrith, DMR (1990[8]) indicates that the site is within the Richmond Soil Landscape group. This group of landscape is characterised by quaternary terraces of the Nepean and Georges Rivers. Relatively flat (slopes <1 %) and level. Splays, levees provide local relief of <3 m. Formerly a low open woodland. Richmond soils are poorly structured orange to red clay loams, clays and sands. Texture may increase with depth. Ironstone nodules may be present. Plastic clays in drainage lines, red earths and red podzolic soils occur on terrace surfaces with earthy sands on terrace edges. Limitations of the Richmond group include high erosion hazard on terrace edges and minor localised flooding.

The lithology observed during previous investigations (PSM 2017[9], JBS&G 2017and 2018) is as follows:

- Shallow to moderately deep alluvial soils comprising clay to sandy clay (present from a depth of 0.4 m to 10.5 m below ground surface (bgs));
- Moderately deep to deep alluvial clay to sandy clay mixed with Nepean River gravels (present from a depth of 6.1 m to 13.0 m bgs); then
- Residual shale bedrock (present from a depth of 13.0 m to 15.0 m bgs).

3.6 Salinity

Reference to the Department of Infrastructure, Planning and Natural Resources salinity potential map GS912, DIPNR (2002[10]), has indicated that the site exists within an area of 'moderate salinity potential'.

Vegetation at the site during the site inspection did not exhibit any indicators of salinity related stress.

3.7 Hydrology

Rainfall is considered likely to migrate primarily through surface water runoff into the municipal stormwater system. Minor infiltration into the underlying porous soils and surface is also expected in areas of unsealed ground.

As discussed in **Section 3.2**, the site is largely covered by concrete, asphaltic pavements and building footprints. As such, surface water generated during periods of rainfall is anticipated to primarily enter the municipal stormwater system; via discharge into onsite stormwater catchment infrastructure or alternatively discharge into stormwater pits within the surrounding roadways.

The nearest water body to the Site is Peach Tree Creek, approximately 1.1 km to the west of the site boundary. Peach Tree Creek ultimately contributes to the Nepean River. Municipal stormwater discharges to the Nepean River.

3.8 Hydrogeology

Registered groundwater bore information was obtained from the NSW Department of Primary Industries groundwater mapping tools, NSW DPI (2016[11]). A review of the registered bore information indicated that there were thirteen bores within a 1.5 km radius of the Site. Based on the reported geology, topography and depth to groundwater, groundwater migration is expected to occur in a north-westerly direction, towards Peach Tree Creek approximately 1.2 km away. Groundwater has been reported in the surrounding properties within the river gravels layer. The DGI (JBS&G 2019a) reported groundwater depths ranging from 6.96 m to 8.05 m bgs, flowing in a north-westerly direction.

Registered groundwater bores located within a 1.5 km radius of the site are used for monitoring, recreational and testing purposes. Given the relatively dense urban use of the site and surrounding properties, in addition to the identified licensed bores, there is a moderate probability of additional undocumented bores near the site. No reported utilisation of groundwater as a drinking water source has been reported.

3.9 Acid Sulfate Soils

The Guidelines for the Use of Acid Sulfate Soil Risk Maps, Department of Land and Water Conservation (DLWC) (1997[12]), has indicated that acid sulfate soils (ASS) are likely to be located in coastal lowlands up to about 10 m AHD. No risk map for the area encompassing the site was provided as part of the acid sulfate soil risk map series, DLWC (1998). Review of the geographical and topographical location of the site has indicated that it is a significant distance away from tidal creeks or estuaries, and it is considered unlikely that ASS would exist at the site.

Three Section 149(2&5) planning certificates were obtained for the site, provided in the DSI (JBS&G 2017a). The land was not identified to have been affected by a policy adopted by Council or adopted by any other public authority, notified to Council, that restricts the development of the land because of the likelihood of ASS.

No staining, odours or other indicators of ASS were observed during the DSI or DGI (JBS&G 2017 and 2019a).

Version: 1, Version Date: 14/04/2021

3.10 Meteorology

A review of average climatic data for the nearest Bureau of Meteorology monitoring location (Penrith Lakes[13]) indicates the site is located within the following meteorological setting:

- Average minimum temperatures vary from 5.5 ^{o}C in July to 18.5 ^{o}C in January;
- Average maximum temperatures vary from 17.7 ^{o}C in July to 30.7 ^{o}C in January;
- The average annual rainfall is approximately 728.1 mm with rainfall greater than 1 mm occurring on an average of 71.7 days per year; and
- Monthly rainfall varies from 30.6 mm in September to 121.4 mm in June with the wettest periods occurring on average in January to June.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. Summary of Site History

The historical contamination assessments undertaken at the site (Geo-Logix 2016, JBS&G 2017 and 2018) presented a site history review based on the following information sources:

- Section 149(2&5) certificates obtained from council from three representative lots;
- Current and historical land title records;
- Records of stored Dangerous Goods held by WorkCover;
- Historical aerial photographs obtained from the Department of Lands;
- Publicly available heritage records held by the Department of Planning and Environment and Council, where readily available;
- Council Development Application / Building Application (DA/BA) records; and
- Records of environmental incidents, former environmental licences, or contaminated land notices or notifications, available from the EPA.

The site has been used for a range of residential and commercial purposes throughout the period to which records are available. Section 149 (2&5) certificates, historical land title records and aerial photographs indicate that the site comprised primarily low density residential premises from 1881 to 1949, following which it was progressively redeveloped into a commercial precinct.

The commercial precinct included mostly low-risk activities such as restaurants, retail and other services. Two premises were identified to have previously been used for activities with elevated potential to cause contamination of the land:

- Shop 3/134-138 Henry Street, Penrith – dry cleaning services (1977 – 2016); and
- 118-120 Henry Street, Penrith – garage proprietary services (1967 – 1973).

Historical assessments (Geo-Logix 2016, JBS&G 2017 and 2018) have identified contamination within the vicinity of the former dry cleaner (Shop 3/134-138 Henry Street). Following identification of contamination underlying and within the vicinity of the premises, Council notified the NSW EPA of contamination present at Shop 3/134-138 Henry Street.

Subsequently the EPA provided a response to Council (EPA 2018[14]) which made the determination that regulation of the chlorinated hydrocarbon impacts present at Shop 3/134-138 Henry Street under the *Contaminated Land Management Act 1997* was not currently required.

No items of aboriginal or European heritage were identified at the site.

[14] *Former Dry Cleaners – 134-138 Henry Street, Penrith*. NSW Environment Protection Authority Reference DOC17/523668-04

Document Set ID: 9547379

5. Previous Investigations

The following provides a summary of the information and site characterisation data presented within key assessment reports. These reports include both historical and information relating to investigations conducted at that time.

Comments in relation to contaminants of potential concern (COPC) are provided in the following text in relation to assessment criteria adopted at the time of report preparation.

Sample locations completed during JBS&G (2017 and 2019a) are shown on **Figure 4A** to **4D**. Exceedances of assessment criteria specific to the sample location and to the future proposed land-use of the area are also shown on **Figure 4A** to **4D**. Historical sample results are compared against assessment criteria within **Table A(1), Table A(2), Table B, Table C** and **Table D.**

5.1 Preliminary Environmental Site Assessment Report, Geo-Logix (2016)

Council engaged Geo-Logix Pty Ltd (Geo-Logix) to conduct a preliminary ESA, Geo-Logix (2016) at the property located at 134-138 Henry Street, Penrith, NSW (the preliminary assessment area, Lot 1 DP164798, **Figure 2**). The preliminary assessment was undertaken to assess the potential for contamination to exist at the site given the presence of Shop 3/134-138 Henry Street within the preliminary assessment area.

The preliminary ESA indicated that the site appeared to be vacant until the 1950s. In the period intervening construction of the current building layout and its former vacant use, the site was used for storage of materials. The building layout as observed in the current investigation was constructed during the 1960s and the dry cleaner operated from 1977. Additionally, aerial photographs provided as part of the report indicated that a service station operated from the 1950s to the 1970s (The Service Station, Lot 1 DP113118, **Figure 2**) which was considered to potentially comprise an off-site contamination source for the preliminary assessment area (134-138 Henry Street). It is noted that the historical service station area forms part of the PCPV.

Geo-Logix carried out passive soil vapour assessments at two locations within the dry-cleaning shop. Chlorinated ethenes (CEs) PCE, TCE and DCE were detected in soil vapour samples at concentrations in exceedance of the commercial land-use criteria adopted for the assessment. Additionally, benzene, toluene, ethylbenzene and xylene (BTEX) compounds were detected within the soil vapour at concentrations above the laboratory limit of reporting (LOR) but below the commercial land use criteria. Geo-Logix did not identify onsite migration of contaminants from the former service station as a likely source for these BTEX compounds. The preliminary ESA report identified the presence of potential asbestos containing materials (ACM) forming part of the construction of building within the assessment area.

The site was notified to the EPA by Council following the works undertaken by Geo-Logix in accordance with the *Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997* (EPA 2015[15]).

5.2 Phase 2 Environmental Site Assessment, JBS&G (2017)

5.2.1 Introduction

JBS&G was engaged by Council to undertake a DSI at the site. The objective of the DSI was to determine potential for contamination based on current and historical site activities and to draw conclusions regarding the potential contamination status of the site for the proposed land-uses, or make recommendations to enable such conclusions to be made. Consideration was given to the

[15] *'Guidelines on the Duty to Report Contamination under the Contaminated Land Management Act 1997*'. NSW Environment Protection Authority, September 2015, EPA 2015;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

potential for contamination to represent unacceptable risks to future site users based on future land uses proposed under the Central Park Village redevelopment.

The assessment comprised a review of Geo-Logix (2016), the site's environmental setting and historical site activities in conjunction with a field investigation. The field program included inspection, sampling and analysis of soil samples from 28 borehole locations, 3 groundwater samples from monitoring wells installed as part of the program and 10 soil vapour samples collected from sub-slab soil vapour probes. The sampling locations undertaken as part of the DSI, including exceedances of the relevant criteria are shown on **Figure 4A** to **4C**. JBS&G indicated that the presence of buildings and occupied tenancies during the investigation precluded detailed assessment of all site areas.

The site history assessment indicated that the site has been used for a combination of residential and commercial purposes over the period of available records. Historical land title records, obtained for three of the legal properties, indicated that the premises were owned for residential purposes, prior to light commercial use (retail, service station and funeral home facilities). The site was identified to have undergone numerous redevelopments comprising demolition of former structures. Geo-Logics (2016) was reviewed as part of the site history investigation, which indicated the former dry-cleaning operation was a potential source of contamination.

The desktop assessment identified a range of COPCs associated with the following AECs:

- The dry cleaner (Shop 3/134-138 Henry Street, **Figure 3**): improper disposal of dry cleaning chemicals resultant from the operation of the dry cleaner;
- The Service Station (118-120 Henry Street, **Figure 3**): improper management of petroleum hydrocarbons associated with the operation of the former service station;
- Whole of Site: impacts to potential imported fill materials and disturbed/reworked natural materials:
  - Fill materials of unknown origins observed to be present due to site development activities;
  - Pesticide and herbicide application associated with onsite residential maintenance activities within surficial-moderately deep fill and natural soils;
  - Fuel and oil spills associated with onsite residential maintenance activities; and
  - Hazardous building materials associated with existing and former site structures.

5.2.2 Results of the Assessment

Bore and groundwater installation logs are presented in **Appendix C**. The logs indicate that underlying hardstand pavements, fill materials were encountered to depths ranging from 0.2 m and 2.0 m bgs. Fill comprised a combination of silts and clays with varying sand content. Colours were observed to be primarily brown and grey with some orange/yellow clays also encountered. Anthropogenic inclusions were observed within fill material from some locations. Three distinct natural materials were encountered during the investigation: silty/sandy clay which exhibited increasing (although still minor <10 %) sand content with depth (0.2 m – 10.5 m bgs), Nepean River gravels (6.1 m – 13.0 m bgs) and shale bedrock (>11.7 m bgs). No ACM, odours or staining were observed on site surfaces or within the soil profile at any investigation location. No PID readings >1 ppm were reported during field screening for volatile organic compounds during soil sampling.

Sample results from the soil vapour sampling and analyses indicated that CE impacts are present within the vicinity of the dry cleaner. Volatile gas impact extends north of the dry cleaner, along the inferred groundwater flow direction, with exceedances of the soil vapour criteria for PCE and TCE identified from gas samples taken at probe locations SV05 and SV10 (**Figure 4C**). It is noted that the most significant concentrations were detected at location SV05, approximately in line with the

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

inferred groundwater flow direction, and that no exceedances of the site investigation criteria were reported east or south of the dry cleaner.

Contaminants in soils and groundwater were generally not present at concentrations statistically significant and exceeding the site assessment criteria, with the exception of the following:

- Concentrations of PCE (0.059 mg/L) and toluene (0.094 mg/L) in groundwater, collected from location PSM01, were present at concentrations exceeding the adopted drinking water criteria, which was considered to represent a potential unacceptable risk to future onsite receptors.

In addition to the above, exceedances of the laboratory LOR for TRHs were reported in groundwater samples from PSM01, PSM02 and PSM03, the source for which was unclear. The concentrations were not considered representative of a risk to future onsite/offsite receptors.

Groundwater and soil concentrations within the vicinity of the dry cleaner also indicated the presence of CEs, primarily PCE and TCE, albeit at concentrations which were below the adopted site assessment criteria. With respect to the position of the dry cleaner, the inferred groundwater flow direction and the sewer diagrams provided in **Appendix E**, the presence of elevated PCE and TCE within the groundwater sample from PSM01 indicates that CEs may have migrated along the sewerage infrastructure prior to their release into the environment.

5.3 Shop 3 Gaymark Lane, Penrith, NSW – Human Health Risk Assessment, JBS&G (2017b)

JBS&G was engaged by Council to provide an assessment of the potential human health risk to future commercial occupants of the building described as Shop 3 Gaymark Lane, as located in the southern portion of Shop 3/140 Henry Street.

The Human Health Risk Assessment (HHRA) was considered warranted based upon a review of environmental data provided in JBS&G (2017), to determine whether soil, groundwater and/or soil vapour impact reported in JBS&G (2017) posed an unacceptable risk to a proposed future use of the premises for commercial purposes. This has been interpreted as consisting of occupation of the building for commercial activity/durations by adults to assess the risk posed to future occupants of the premises.

The risk assessment considered maximum levels of TCE and PCE recorded in soil vapour in proximity to the premises, and the levels reported adjoining the premises. A sensitivity analysis was undertaken with the risk assessment which found that the estimated levels of risk were considered suitably conservative to premise decision making in relation to objectives stated.

The levels of sub-surface impact were reported to not pose an unacceptable health risk to potential future commercial users of the site. JBS&G stated that there was no potential for aesthetic impacts through recognition of odours associated with the site impact.

5.4 Data Gap Investigation – Penrith Central Village Park (JBS&G 2018a)

JBS&G was engaged to complete a data gap investigation (DGI, JBS&G 2018a) following identification of contamination potentially associated with the former dry cleaner. The DGI comprised targeted soil, groundwater, soil-vapour and indoor air sampling. The DGI reviewed historical DA/BA records for the former dry cleaner and service station. Additionally, sewer service diagrams for the dry cleaner were presented within the report (**Appendix E**).

JBS&G advanced six boreholes within the vicinity of the former dry cleaner (JBMW01 to JBMW05 and SV19). Three boreholes were advanced adjacent to the northern boundary of the site (JBMW02, JBMW05 and SV19), two advanced approximately 50 m west of the dry cleaner and one northeast of the dry cleaner, downgradient of the former service station. Additionally, two boreholes (JBMW06 and JBMW07) were advanced into the property locatd at 48 Belmore Street, approximately 100 m north of the dry cleaner. Selected soil samples were submitted for the following laboratory analysis:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- 8 samples for VOCs;
- 3 samples for PAHs;
- 3 samples for lead;
- 2 samples for fraction organic carbon (Foc); and
- 1 sample for heavy metals (As, Cd, Cr, Cu, Pb, Hg, Ni and Zn).

Encountered lithological conditions were generally consistent with those reported in JBS&G (2017). Shallow fill was encountered ranging from 0 to 1.2 m bgs, overlying silty and sandy mottled clays (0.4 to 8.9 m bgs), in turn overlying gravelly sandy clay (6.5 m to 12.1 m bgs). Residual shale bedrock was encountered at 11.5 m to 12.1 m bgs at locations JBMW01 to JBMW04.

Seven of the boreholes were converted to groundwater monitoring wells, which were later developed and sampled in addition to previously installed wells (PSM01, PSM02 and PSM03). The groundwater well installation logs are provided as **Appendix D**. Groundwater was sampled over two mobilisations with wells JBMW02 and PSM01 sampled twice. Groundwater samples were analysed for a range of COPCs (VOCs, TRHs and heavy metals).

JBS&G installed 7 sub-slab soil vapour probes surrounding Shop 3/134-138 Henry Street and following sewerage service infrastructure (**Figure 4C**). The sub-slab soil vapour probes were used to access shallow soil vapour. In addition, two boreholes (JBMW05 and SV19) were converted to deep soil vapour wells on the northern side of Henry Street. Soil vapour was sampled via extraction of soil vapours and sorption of VOCs to laboratory prepared carbon tubes. All seven samples were analysed for VOCs.

JBS&G conducted four rounds of indoor air monitoring at 134-138 and 140 Henry Street. Indoor air was sampled at several locations within the shops over 8-hour periods using summa canisters. The indoor air samples were analysed for VOCs. Atmospheric conditions were reported to vary over the sample periods which targeted hot and pressure drop conditions.

Laboratory analytical results are discussed as follows:

- No statistically significant exceedances of the site investigation criteria were reported for COPCs in soils;
- Groundwater concentrations were less than relevant environmental guidance values, with the exception of PCE in JBMW02 (0.15 mg/L) which exceeded the adopted ANZECC (2000[16]) 95 % protection and NHRMC (2017[17]) drinking water criteria;
- CEs were detected in SV11, SV14 and SV16, but were less than the adopted site assessment criteria, with the exception of SV14. PCE (42 mg/m^3) and TCE (2.88 mg/m^3) exceeded the adopted site assessment criteria (HIL-C, NEPM 2013) at location SV14. It is additionally noted that TCE was detected in SV14 at a concentration of 0.168 mg/m^3, exceeding HIL-B and HIL-D criteria.
- Indoor concentrations were generally less than the adopted screening criteria, with the exception of location 140_SHOP (9 April 2018). The concentration of TCE (20 µg/m^3) reported at location 140_SHOP on 9 April 2018 exceeded the adopted indoor air screening criteria.

Version: 1, Version Date: 14/04/2021

6. Conceptual Site Model

6.1 Overview

NEPC (2013) identifies a CSM as a representation of site related information regarding contamination sources, receptors and exposure pathways between those sources and receptors. The development of a CSM is an essential part of all site assessments.

NEPC (2013) identified the essential elements of a CSM as including:

- Known and potential sources of contamination and contaminants of concern including the mechanism(s) of contamination;
- Potentially affected media (soil, sediment, groundwater, vapours etc.);
- Human and ecological receptors;
- Potential and complete exposure pathways; and
- Any potential preferential pathways for vapour migration (if potential for vapours identified).

6.2 Potentially and Contaminated Media

Areas of environmental concern are shown on **Figure 3**. Potential and known contaminated media comprise:

- Fill materials;
- Underlying natural soils;
- Subsurface vapour and ground gases; and
- Groundwater

Table 6.1 Areas of Environmental Concern and associated Contaminants of Potential Concern

Areas of Environmental Concern (AEC)	Contamination Status	Potentially Contaminated Media	Contaminants of Potential Concern (COPC)
AEC 1 – Former Dry Cleaner 134-138 Henry Street (Lot 1 DP164798) Improper disposal/management of dry-cleaning chemicals	Known	Soil, groundwater, soil-vapour and indoor air	Chlorinated Ethenes (PCE, TCE, DCE)
AEC 2 – Former Service Station 118 Henry Street (Lot 1 DP113118) Potential UPSS and improper management of petroleum hydrocarbons	Potential	Soils	TRHs, PAHs, BTEX and lead
AEC 3 – Transformers Historical spillage/leakage of transformer oils underlying transformers within the Allen Place carpark.	Potential	Soils	TRHs and PCBs
AEC 4 – Fill material Underlying Buildings Fill materials of unknown origin used for site levelling and activities associated with development. Application of COPCs as a result of general maintenance during site occupation (pesticides, herbicides, fuel and oil spills etc).	Potential	soils	Heavy metals, PAHs, TRH, BTEX, OCPs, PCBs, VOCs and asbestos

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.2.1 AEC 1 Former Dry Cleaner

Soil, soil vapour and groundwater samples obtained during the DSI (JBS&G 2017a) and DGI (JBS&G 2019a) indicate that the greatest levels of chlorinated ethene impact is in the immediate vicinity 134-138 Henry Street and extending north and west of the premises. Detections of contaminant concentrations a considerable distance west of the premises provide evidence that the compounds may have migrated along the inferred sewerage infrastructure alignment. Impacts to site media are detailed in **Section 6.2.1.1** to **Section 6.2.1.4**

6.2.1.1 Soil Impacts

Soil samples analysed as part of the previous (JBS&G 2017a) and DGI (JBS&G 2019a) have not identified gross and/or widespread soil contamination. No soil samples analysed within the groundwater table, or nearby to sewerage infrastructure were reported to contain COPCs above the laboratory limit of reporting. Minor concentrations of PCE and TCE at location JHA04, underlying Shop 3/140 Henry Street, were reported in JBS&G (2017a).

Notwithstanding, it is considered likely that soils surrounding the sewerage infrastructure, and underlying the dry cleaner, have historically been impacted by dry cleaning solvents. The maximum levels of TCE reported in sub slab vapour are consistent with a source of chlorinated ethene being present in the unsaturated zone. Chlorinated ethenes can commonly be heterogeneously distributed through a soil profile, and localised within the extent of a sample of soil collected in clay based soils. Due to their characteristics subsurface chlorinated ethene impacted soils are not typically readily identified. Impacted soils are considered to potentially represent an ongoing source of contamination to both groundwater and soil vapour.

6.2.1.2 Groundwater Impacts

Groundwater analytical results indicated that PCE was present at concentrations exceeding the investigation criterion at JBMW02 and JBMW05, and above the laboratory limit of reporting in JBMW03, PSM01 and PSM03. Chlorinated ethenes were not detected in samples of groundwater collected from JBMW01, JBMW04, JBMW06, JBMW07 or PSM02. Trace concentrations of TCE in groundwater were reported at locations JBMW02 (0.002 mg/L to 0.009 mg/L), JBMW05 (0.002 mg/L) and PSM01 (0.001 mg/L).

It is noted that JBMW02 and JBMW05 are over the northern boundary of the site, providing evidence that the impact has migrated off the site via the groundwater. No groundwater monitoring wells have been installed directly into the chlorinated ethene impact source zone, although it is considered likely that the highest concentrations of chlorinated ethenes will be present directly underneath the dry cleaner.

Impacts to groundwater have been delineated north (JBMW06 and JBMW07), east (JBMW03), south (PSM02) and west (JBMW01 and JBMW04). Potential remains for groundwater impact to be present further northwest of JBMW05.

6.2.1.3 Soil vapour Impacts

Shallow Soil Vapour

Results obtained from the DGI (JBS&G 2019a) have shown that significant concentrations of PCE and TCE are present within shallow soil vapour (<0.3 m bgl) surrounding the dry cleaner. Soil vapour contaminant samples collected from locations SV11, SV14 and SV16 were reported to have concentrations of CEs above the laboratory limit of reporting. The highest results reported during the current assessment were associated with location SV14, which was placed immediately overlying sewerage infrastructure servicing the dry cleaner. Soil vapour samples collected from locations SV12, SV13, SV15 and SV17 were not reported to have any VOCs above the laboratory limit of reporting.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Within samples where both TCE and PCE were detected above the laboratory LOR, the ratio of PCE/TCE ranged from 4.143 to 14.49.

The distribution of CEs in soil vapour has provided evidence that the compounds have migrated within/alongside the sewerage infrastructure a considerable distance from the dry cleaner (>50 m). In addition, impacted soil vapour may be migrating over the northern boundary of the site, as indicated by elevated concentrations in SV11.

The investigation results indicate that the occurrence of CEs in shallow soil-vapour is not strongly correlated with presence in groundwater. Whilst volatilisation of CEs from groundwater is likely to be occurring, it is considered unlikely that it is occurring at a level which represents a risk to future site users on the basis of the following considerations.

- SV09 contained no soil vapour concentrations above the laboratory LOR with elevated underlying groundwater impact (PSM01, 0.033 mg/L to 0.059 mg/L);
- The largest groundwater impact (JBMW02) was near two soil-vapour sample locations which were reported to contain minimal concentrations (SV11) to no detection (SV12) of CEs in soil-vapour were present;
- SV16 contained elevated concentrations of CEs with no underlying groundwater impact (JBMW04), and the highest reported soil vapour impact is overlying adjacent to the sewerage infrastructure (SV14); and
- Groundwater is in excess of 7 m below the current ground surface.

Deep Soil Vapour

Two deep soil vapour samples were taken north of the former dry cleaner (SV18 and SV19). Samples were collected from 4.7 m to 5.0 m below ground levels. Highly elevated CEs were detected in both samples, exceeding interim HILs:

- SV18: PCE (367 mg/m^3) and TCE 1.62 (mg/m^3); and
- SV19: PCE (1300 mg/m^3) and TCE 8.83 (mg/m^3).

These results are indicative of the presence of contamination at beneath/adjacent to the former dry cleaners at depth. The relatively low concentrations in groundwater indicate that the deep source is unlikely to be present in the saturated zone. Additional assessment will be required to determine the extent of remediation required to address the presence of elevated CE in deep offsite soil vapour.

6.2.1.4 Indoor Air

Indoor air was sampled over four monitoring events (9 and 17 April 2018, 3 May 2018 and 15 November 2018). Samples analysed from Shop 3/134-138 Henry Street and Shop 3/140 Henry Street have indicated that the PCE is present within the indoor air of both premises. TCE was generally not detected above the laboratory limit of reporting in the analysed samples, with the notable exception of 140_SHOP on 9 April and 3 May 2018. **Table 6.2** and **Table 6.3** show ratios of indoor air to sub-slab vapour concentrations, and relative PCE to TCE concentrations within samples.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 6.2 Indoor Air and Sub-Slab VOC Concentrations

Sample Location	Highest Indoor Air Concentration (µg/m³)	Closest Sub-Slab Soil Vapour Concentration (µg/m³)	Indoor Air to Sub-slab Soil Vapour Ratio
Tetrachloroethene			
140_BATH	<3	14 500 (SV10)	<0.00021
140_SHOP	5	14 500 (SV10)	0.00035
DC_BATH	8	40 000 (SV14)	0.00020
DC_SHOP	8	40 000 (SV14)	0.00020
Trichloroethene			
140_BATH	<2.7	3500 (SV10)	<0.00077
140_SHOP	20	3500 (SV10)	0.00571
DC_BATH	<2.7	2760 (SV14)	<0.00098
DC_SHOP	<2.7	2760 (SV14)	<0.00098

Table 6.3 PCE to TCE Ratio in Site Media

Sample Location	Highest PCE Concentration (µg/m³)	Highest TCE Concentration (µg/m³)	Ratio of PCE/TCE	Approximate Distance From Shop 3/140 Henry Street / Distance From Shop 3/134-138 Henry Street (m)
Indoor Air				
140_BATH	<3	<2.7	-	Internal
140_SHOP	5	20	0.250	Internal
DC_BATH	8	<2.7	>2.963	Internal
DC_SHOP	8	<2.7	>2.963	Internal
Sub-Slab				
SV05	56 667	9333	6.072	<5 / 20
SV10	14 500	3500	4.143	Underlying / 15
SV14	40 000	2760	14.49	Boundary / < 5
SV16	1520	168	9.047	30 / 40

One reported concentration of TCE within indoor air sample 140_SHOP, 9 April 2018 (20 µg/m³), was inconsistent with the subsequent three samples taken at the same location, 17 April 2018 (<2.7 µg/m3),3 May 2018 (5 µg/m³) and 15 November 2018 (<2.7 µg/m³).

The ratio between TCE and PCE in this indoor sample was significantly different to all sub-slab soil vapour samples in which both TCE and PCE were detected. On this basis, the elevated concentration is considered likely to be the result of an additional, internal source within the premises, and is not considered to be reflective of CE advection from the sub-slab soil vapour.

6.2.2 AEC 2 Former Service Station

Environmental samples analysed as part of the site investigations (JBS&G 2017 and 2018) have provided evidence that gross and/or widespread contamination as a result of the former service station operation has not occurred.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Soil samples analysed from JBMW03, JHA04 and JHA06 were reported to have concentrations of TRHs below the adopted site investigation criteria. Soil vapour samples analysed from four locations surrounding the premises were reported to have concentrations of TRHs and BTEX compounds below the laboratory LOR or the site investigation criteria. No TRHs, PAHs or lead in groundwater above the laboratory LOR were reported at JBMW03. If any impacts to soil, groundwater or soil vapour have occurred as a result of the operation of the former service station, it is considered likely that they will be limited to minor, localised hotspots.

6.2.3 Additional Issues

Additional known and potential contamination issues identified are detailed in **Section 6.2.3.1** to **Section 6.2.3.3**.

6.2.3.1 Soil Characterisation

A total of 34 boreholes have been drilled across the site, on a generally systematic grid basis. The boreholes have been skewed as a result of the presence of site structures and to target AECs. Boreholes have provided adequate site coverage to inform site fill characterisation across the majority of the site. Notwithstanding, additional assessment/investigation of soils should be undertaken following removal of buildings to confirm that soil characteristics are consistent with those encountered across the balance of the site.

Fill materials have been reported/encountered across the entire site ranging from 0.15 m to 1.9 m depth. On average, the depth of fill is approximately 0.5 m (**Figure 6**). Fill was generally deeper underlying the commercial properties at the site, and shallower throughout the Allen Place car park. A deeper pocket of fill was identified at JB18 and JB19 terminating at 1.8 m and 1.9 m bgs respectively.

Fill materials are considered to be present due to a combination of historical land use activity and soil importation to establish levels/back fill services. Fill materials were generally identified to comprise a combination of silts and clays with varying sand content. Colours were observed to be primarily brown and grey with some orange/yellow clays also encountered. Anthropogenic inclusions were observed within fill material from some locations.

As presented in the characterisation summary tables (**Table A(1), Table A(2), Table B, Table C** and **Table D**) and **Figure 4A B**, fill materials have been shown to sporadically contain heavy metals (lead, nickel and zinc), TRH/TPH, PAHs, carcinogenic benzo(a)pyrene TEQ equivalent, CEs and asbestos to varying degrees. Statistical analysis of the contaminant data sets for soils, presented in JBS&G (2018), indicate that there are no statistically significant exceedances of the site suitability criteria (**Section 8**).

Identification of asbestos in soils was limited to a single occurrence of asbestos fines in shallow soils at location JB11. The concentration of asbestos was less than the site suitability criteria. It is noted, given the occurrence of anthropogenic inclusions within the fill soil profile, and the historical nature of the site, potential remains for additional asbestos impact within the fill.

Based on data presented in JBS&G (2017 and 2018), contaminant impacts in fill material appear to be associated with identifiable physical characteristics (such as the presence of slag, odours or staining), or underlying discrete point sources (JHA04, former dry cleaner).

With the exception of the above, and impacts discussed in **Section 6.1.1**, soils at the site are considered to be generally free from contamination. No odours, staining or asbestos were observed in any of the historical or current investigation locations. It is noted that the character of soils underlying existing building footprints, and underlying the four onsite transformers, has not yet been determined. Additionally, given the limitation of soil investigations via boreholes, there is the potential for asbestos impacts to be present within fill that have not yet been identified.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.2.3.2 Groundwater Characterisation

JBS&G (2017 and 2018) assessed groundwater conditions within eight wells, six on site (PSM01 to PSM03 and JBMW01, JBMW03, JBMW04), two adjacent to the northern boundary (JBMW02 and JBMW05) and two on 48 Belmore Street (JBMW06 and JBMW07) over three GMEs. Concentrations of COPCs were reported to be generally less than the adopted site assessment criteria, consistent with the absence of substantial contaminant mass in the overlying soils.

Notwithstanding, groundwater within the vicinity of the former dry cleaner has been reported to be impacted by CEs. Elevated concentrations of PCE, exceeding site investigation criteria (ANZAST 2018 and NHMRC 2017), were reported in offsite well JBMW02 and JBMW05, indicating that migration of the contaminants is occurring over the northern boundary via groundwater. The CE impact to groundwater was not detected in wells west of JBMW02 (JBMW01 or JBMW04) at concentrations exceeding site investigation criteria, providing delineation of the extent of significant impact.

JBS&G (2017) reported elevated concentrations TRHs in PSM01, PSM02 and PSM03, as well as elevated toluene in PSM01. Analytical results from later sampling rounds have indicated that these compounds were either not detected above the laboratory LOR or detected at substantially lower concentrations. It is considered that these compounds may have been associated with drilling advancement fluids employed as part of the geotechnical drilling methodology utilised for the installation of these wells.

Analysis of heavy metals within JBMW03 has identified arsenic and nickel at concentrations exceeding the adopted site criteria.

Groundwater at the site has been reported to be saline and unsuitable for use as drinking water. Saline groundwater was reported within the inferred upgradient well (PSM03), indicating that it is the result of background hydrogeological conditions and/or migration on to the site.

6.2.3.3 Soil Vapour and Indoor Air

Except for 134-138 and 140 Henry Street, no potential for soil-vapour or indoor air impact which may represent an unacceptable risk to future site users has been identified within the PCPV site.

6.3 Potential for Migration

Contaminants generally migrate from site via a combination of windblown dusts, rainwater infiltration, groundwater migration and surface water runoff. The potential for contaminants to migrate is a combination of:

- The nature of the contaminants (solid/liquid and mobility characteristics);
- The extent of the contaminants (isolated or widespread);
- The location of the contaminants (surface soils or at depth); and
- The site topography, geology, hydrology and hydrogeology.

The contaminants of concern identified in JBS&G (2017, 2019a and 2019b) are generally in solid (e.g. asbestos, metals and PAHs), liquid (e.g. VOCs, TPH and BTEX) or gaseous (e.g. VOCs, BTEX, Volatile TRH) form.

As the ground surfaces across the site primarily comprise sealed asphalt or concrete pavements and building footprints, the potential for windblown dust migration of contamination is generally low. The potential for contamination migration via surface water movement and infiltration of water and subsequent migration through the soil profile is considered generally to be low given the extent of impermeable pavements across the site.

The underlying natural soils at the site comprise primarily clayey soils and are relatively impermeable. Notwithstanding, CEs have been detected within groundwater (PSM01, JBMW02 and

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

JBMW05). On this basis, migration of contaminants via groundwater movement has been identified at the site.

Analysis of soil-vapour samples collected from shallow soils show that shallow soil vapour impacts are generally limited to 134-138 and 140 Henry Street. Deep soil-vapour samples collected on the northern side of Henry Street indicate that soil vapour impacts are present at depth beyond the northern site boundary. The scale of the impacts and generally low concentrations in groundwater imply the potential for a deep source of CEs in unsaturated horizons of soil potentially underlying Henry Street. Offsite vapour generation and transport is identified as a migration pathway.

6.4 Potential Exposure Pathways

Based on the COPC identified in various media, as discussed above, and proposed development activities, the exposure pathways for the site during and following development works are discussed below.

6.4.1 Recreational Public Open Spaces

Recreational public open spaces comprise areas which will not be used for building development (**Figure 2**). The following exposure pathways are relevant for site receptors within public open spaces:

- Potential dermal and oral contact to impacted soils as present at shallow depths and/or accessible by future service excavations; and/or
- Potential oral and dermal contact to groundwater as accessible by potential future service installation; and/or
- Inhalation of COPC vapours/gases/fibres migrating upwards from current *in-situ* soils/groundwater; and/or
- Potential contaminant uptake by vegetation proposed to be established in the vegetated areas of the site.

6.4.2 Building Development Areas

Building and development areas are shown on **Figure 2**. The following exposure pathways are relevant for site receptors within building development areas:

- Potential dermal and oral contact to impacted soils as present in areas of accessible soils and/or accessible by future service excavations; and/or
- Potential oral and dermal contact to groundwater as accessible by potential future service installations or potentially intercepted by future basements; and/or
- Inhalation of COPC vapours/gases/fibres migrating upwards or laterally (into basements) from current *in-situ* soils/groundwater; and/or
- Potential contaminant uptake by vegetation proposed to be established in the vegetated areas of the site.

6.4.3 Offsite Exposure

Potential offsite receptors of deep soil vapour impact are identified as basement occupants of 121 Henry Street, Penrith. Potential exposure is through advection of vapours from impacted soils/groundwater into the basement and inhalation by basement occupants. JBS&G (2019b) presents a vapour intrusion assessment, based on current site conditions, which indicates that no unacceptable concentrations of contaminants have been identified in indoor air within the basement of 121 Henry Street.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The DGI provides a discussion of dilution/attenuation of contaminants within groundwater prior to discharge to the receiving water body (Peach Tree Creek), contaminant uptake by sensitive ecological receptors within the water body is considered not to be a potential exposure pathway which warrants further consideration.

Given the character of the groundwater, and the absence of identified groundwater bores within the vicinity of/downgradient of the site, potential beneficial reuse of the groundwater is not anticipated. Additionally, it is noted that groundwater is present at considerable depth below the current ground surfaces (7 to 8 m bgs). However, it has been conservatively assumed that groundwater may be intercepted by during construction of future basements within the residential/commercial precinct.

6.5 Receptors

Potential receptors of environmental impact present within the site which will require to be addressed include:

- Future occupants and/or site users who may potentially be exposed to COPC through direct contact with impacted soils, groundwater (within basements) and/or inhalation of vapours associated with impacted soils; and/or
- Excavation/construction/maintenance workers conducting activities at or in the vicinity of the site, who may potentially be exposed to COPC through direct contact with impacted soils/groundwater present within excavations and/or inhalation fibres/vapours associated with impacted soils/groundwater; and/or
- Future excavation/construction/maintenance workers who may potentially be exposed to volatile or semi-volatile COPCs through the inhalation of vapours via migration; and/or
- Current and/or future flora at the site who may be exposed to contaminants via direct uptake into root systems.

6.6 Preferential Pathways

For the purpose of this assessment, preferential pathways have been identified as natural and/or man-made pathways that result in the preferential migration of COPC as either liquids or gases.

Natural preferential pathways are likely limited to natural lithological borders, such as between porous soils and bedrock, where infiltrating groundwater is vertically confined and begins to migrate laterally.

Man-made preferential pathways are present throughout the site, generally associated with sub-surface service easements and areas of previously disturbed fill material.

The sewerage infrastructure abutting the western boundary of the former dry cleaner has been identified as a preferential pathway, and is considered likely to have potentially facilitated transport of CEs from the dry cleaner. Preferential pathways can be created by the generally higher permeability fill materials used as backfill to re-instate sub-surface service easements.

6.7 Data Gaps

Potential data gaps include:

- **AEC 1 –** Greater detail on the vertical and lateral distribution of TCE and PCE source material in soils underlying 134-138 and 140 Henry Street as inferred to be causing elevated levels of soil-vapour impact in shallow soils and at depth on the site.

  Where basements are proposed within 30 m of identified impacts, additional assessment of soil-vapour impacts is required to determine whether potential deep vapour impacts represent a risk to future developments;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- **AEC 2 –** The occurrence of UPSS infrastructure and/or potential localized soil/soil-vapour impacts at 118-120 Henry Street;
- **AEC 3 –** Potential occurrence of impacted oils within shallow soils underlying transformers within the Allen Place Car Park; and
- **AEC 4 –** Potential occurrence of localised areas of asbestos impact and/or dissimilar fill characteristics material underlying current hardstand pavements and building footprints.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. Remedial Action Plan

7.1 Remedial Goal

The goal for the remediation and/or management of environmental impact is to:

- Remove unacceptable risks to human populations living at/working on/visiting the site posed by impacted site media;
- Remove or manage unacceptable ecological risks to flora/fauna posed by site media;
- Complete remediation work with in accordance with the principles of ecologically sustainable development (ESD)

7.2 Extent of Remediation

Based on the CSM and consideration of the proposed development it is considered that the following scope of remedial works is required for the site:

- AEC 1: A sufficient extent of remediation and/or on-site management of CE impacted soils and local sewerage infrastructure to prevent potential unacceptable exposures to TCE and/or PCE vapours of future occupants of the parkland. This will need to consider potential additional discharge of CEs to groundwater which may result from the removal of current hardstand pavements/coverings. Removal of sewerage infrastructure will be limited to services adjoining 134-138 and 140 Henry Street to the main sewerage infrastructure junction on the southern portion of the two premises (no removal of infrastructure mains is proposed unless substantial additional impacts are identified);
- AEC 2: Potential additional remediation to remove UPSS infrastructure and associated potentially impacted soils, or otherwise manage impacted soils to prevent potential unacceptable risks to future site users (if found to be present during additional assessment, remediation and/or excavation works); and
- AEC3 and 4: Potential additional remediation to remove impacted soils underlying current pavements/buildings/transformers, or otherwise manage impacted soils to prevent potential exposures to asbestos fibres (if found to be present during additional assessment, remediation and/or excavation works).

Characterisation of groundwater undertaken to date has not identified the requirement for groundwater treatment and/or remediation. The source of groundwater impact will be managed as per the above, removing ongoing contribution of COPC. Validation that the groundwater condition remains consistent or improves and does not represent an unacceptable risk to sensitive receptors will be required by the completion of groundwater monitoring and statistical analysis (**Section 8.2.6.7)**.

7.3 Assessment of Remedial Options

The *Contaminated Land Management: Guideline for the NSW Auditor Scheme* (EPA 2017[18]) lists the following order of preference for soil remediation and management:

- On-site treatment of the soil so that the contaminant is either destroyed or the associated hazard is reduced to an acceptable level;
- Off-site treatment of excavated soil so that the contaminant is either destroyed or the associated hazard is reduced to an acceptable level, after which the soil is returned to the site;

[18] *Contaminated Land Management: Guideline for the NSW Site Auditor Scheme (3ed Edition). NSW EPA 2017 (EPA 2017)*

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Removal of contaminated soil to an approved site or facility, followed where necessary by replacement with clean fill; and
- Consolidation and isolation of the soil on-site by containment within a properly designed barrier.

In addition, it is also a requirement that remediation should not proceed in the event that it is likely to cause a greater adverse effect than leaving the site undisturbed. And, where there are large quantities of soil with low levels of contamination, alternative strategies are required to be considered or developed (EPA 2017).

Remedial options have been assessed for the site as detailed in **Table 7.1** following.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 7.1: Remediation Options Assessment Matrix

Remedial Option	Applicability	Assessment
1. On-site treatment so that the contaminants are either destroyed or the associated hazards are reduced to an acceptable level.	AEC 1 – Former Dry Cleaner COPCs: Chlorinated ethenes (PCE, TCE and DCE) All COPCS: **Active *In-Situ* Remediation:** Active remediation of soils/groundwater *in-situ* is achieved by stimulation or injection of biota, or injection of an abiotic reducing agent, which are capable of dechlorinating the COPCs. Bio-remediation of chlorinated ethenes requires reducing conditions which are unable to be readily achieved upon excavation and exposure of soils to atmospheric oxygen. **Passive *In-Situ* Remediation:** Passive remediation of soils/groundwater/soil-vapour *in-situ* is achieved by monitored natural attenuation (MNA). Natural attenuation is governed by physicochemical and biological processes which are native to the relevant aquifer/soils. **Active *Ex-Situ* Remediation:** Active remediation of soils *ex-situ* is achieved by excavation of soils and removal/destruction of COPCs, followed by replacement of soils on the site. Biological destruction of chlorinated ethenes is not readily achieved in oxygen rich environments. Bio-remediation of chlorinated ethenes requires reducing conditions which are unable to be readily achieved upon excavation and exposure of soils to atmospheric oxygen. However implementation of bio-piles may be applicable for removal of VOCs. Bio-piles consist of heaped stockpiles of the soil provided with an internal network of screened piping. Air is extracted from the screened pipe sections, by use of a vacuum pump, or by the use of passive flow devices. Collected air requires treatment/filtration to remove volatile constituents. Fresh air is drawn into the bio-piles over the remainder of the stockpile surface. High concentrations of contaminants, such as anticipated occurrences of phase separated hydrocarbon impact being present on soils, are toxic to the micro-organisms typically preventing effective remediation by bioremediation. Groundwater may be remediated via pump and treat system involving a water treatment plant. Treatment of soils and/or groundwater by highly energy intensive processes such as incineration, washing, pyrolysis and sonic treatment were not assessed given they are not in alignment with the principles of ESD.	AEC 1 COPCs: Chlorinated ethenes (PCE, TCE and DCE) Onsite treatment for removal of chlorinated ethenes is the preferred option where substantial quantities of impacted site media are identified to require treatment under the proposed development scenario. Further detail and discussion is provided below. The success of onsite/offsite treatment is dependent on many factors, including the time available for treatment and soil physicochemical properties. Where onsite/offsite treatment does not reduce COPC concentrations to acceptable levels within reasonable timeframes, Option 3 is the preferred option. All COPCs – The Preferred Option: **Active *In-Situ* Remediation:** Active remediation of *in-situ* media is not a suitable option, given the inferred low hydraulic conductivity of the impacted material which would substantially limit injection of the remediating media (biotic or abiotic). **Passive *In-Situ* Remediation:** Passive remediation via MNA is the preferred option for onsite/offsite impacts where the condition of the site is not proposed to change, and it can be demonstrated that no current/future risk to onsite/offsite receptors is present as a result of the contamination. Where no changes to the existing site condition are proposed, such as underlying the Henry Street road surfaces/footpaths, and it is demonstrated that no ongoing risk to current/future site receptors is present, MNA is the preferred option. Where existing hardstands are to be removed, exposing impacted soils, as is anticipated in the proposed public open spaces, impacted soils will require active remediation prior to implementation of MNA for groundwater/soil-vapour impacts. **Active *Ex-Situ* Remediation:** Remediation of soils by excavation and stripping of VOCs via bio-piles is the preferred option for chlorinated ethene impacted soils. This method will be appropriate for the volatile contaminant impacts where gross hydrocarbon impact is not present, however may not be suitable within clayey soils. The implementation of this method requires consideration of potential time constraints. Bioremediation may be required for extended periods (potentially exceeding six months where soils are fine grained).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Remedial Option	Applicability	Assessment
		Active groundwater treatment is not the preferred option where MNA is able to be implemented per the above. Assessment of energy intensive active treatment technologies has not been completed in detail given they are not in alignment with the principles of ESD.
	AEC 2 – Former Service Station COPCs: TRHs, BTEX, PAHs and Lead No substantial impact to either soil-vapour or groundwater has been identified at the site. Where impacts exist, it is anticipated that they are limited to minor/localised soil hotspots. TRHs and BTEX Given that soil contaminants associated with petroleum storage consist of hydrocarbon constituents, there is a potential that they may be able to be remediated on site by a bioremediation style remediation method. Bioremediation occurs where contaminants are chemically broken-down by the metabolic processes of micro-organisms into less toxic or non-toxic forms. Recent NSW EPA guidance requires bioremediation methods to demonstrate that pollutant emissions are not discharged to the atmosphere. PAHs Polycyclic aromatic hydrocarbons present in site soils are typically restricted to heavier non-volatile constituents. These can be remediated by thermal processes. However, this requires substantial investment in plant and equipment and high energy use. There are a number of microencapsulation treatment technologies which can reduce the mobility of the identified organic contaminants of concern (e.g., cement stabilisation). Lead Metals are unable to be destroyed. However, there are a number of microencapsulation treatment technologies which can reduce the mobility of the identified inorganic contaminants of concern (e.g. cement stabilisation).	AEC 2 COPCs: TRHs, BTEX, PAHs and Lead TRHs and BTEX – The Preferred Option Similar to chlorinated ethenes, TRHs and BTEX compounds are able to be removed from soils by active ex-situ remediation. Bio-piles are the most cost and time effective methodology. Given petroleum products are amenable to aerobic bio-degradation, bio-piles have the secondary benefit of stimulating biological degradation of the products, where identified. Bio-piles are the preferred remedial option where petroleum hydrocarbon impacts to soil are identified. PAHs and Lead – Not a Suitable Option Remediation options are available for PAH contaminated fill contaminants, generally restricted to thermal treatment processes which are energy intensive. These options are not considered consistent with the ESD objectives for the site. Microencapsulation is not considered necessary given the absence of identified groundwater impacts requiring remediation.
	AEC 3 and AEC 4 COPCs: TRHs, PCBs, heavy metals, PAHs, BTEX, OCPs, VOCs and Asbestos	AEC 3 and AEC 4 COPCs: TRHs, PCBs, heavy metals, PAHs, BTEX, OCPs, VOCs and Asbestos

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Remedial Option	Applicability	Assessment
	TRHs, PCBs, OCPs, PAHs and VOCs These compounds are amenable to thermal destruction. Heavy Metals Metals are unable to be destroyed. However, there are a number of microencapsulation treatment technologies which can reduce the mobility of the identified inorganic contaminants of concern (e.g. cement stabilisation). Asbestos There is no known technology to remove asbestos fibres from soils. Asbestos present in non-friable forms can be remediated by screening to remove oversize materials. However, the co-occurrence of a range of construction and demolition materials with the asbestos containing material reduces the potential effectiveness of screening processes. In addition, where asbestos fines impacts have been identified, screening of impacted material increases the risk of exposure to site workers and migration of fibres within the works area.	TRHs, PCBs, OCPs, PAHs and VOCs – Not the Preferred Option The potential quantities of these compounds within AEC 3 and AEC 4 at the site do not warrant the energy and logistical effort required to establish onsite treatment facilities. Further, the energy requirement to facilitate thermal destruction of is not in accordance with the principles of ecologically sustainable development. Heavy Metals – A Potential Option Metals are unable to be destroyed. However, there are a number of microencapsulation treatment technologies which can reduce the mobility of the identified inorganic contaminants of concern (e.g. cement stabilisation). Asbestos – Not a Suitable Option There is no treatment method available for asbestos impacts.
2. Off-site treatment so that the contaminants are either destroyed or the associated hazards are reduced to an acceptable level, after which the soil is returned to the site.	AEC 1 – Former Dry Cleaner COPCs: Chlorinated ethenes (PCE, TCE and DCE) All COPCS: Similar to Option 1, several treatment technologies exist which are capable of removing and/or destroying the COPCs	AEC 1 – Former Dry Cleaner COPCs: Chlorinated ethenes (PCE, TCE and DCE) All COPCs – The Preferred Option: Similar to Option 1 removal of COPCs from site media, and minimization of landfill contributions is the preferred option. Where substantial soil impacts are identified which require treatment, or where other COPCs such as asbestos in soils are identified, this is not a suitable option. AEC 1 to AEC 4 COPCs: TRHs, BTEX, PAHs, Where small quantities of impacted soils require treatment, this is the preferred option. Establishing onsite remediation/treatment facilities carries large establishment costs. However, additional time, energy and costs are incurred to take soils off site and return them to the site.
	AEC 2 – Former Service Station COPCs: TRHs, BTEX, PAHs and Lead	AEC 2 – Former Service Station COPCs: TRHs, BTEX, PAHs and Lead All COPCs: Not the Preferred Option

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Remedial Option	Applicability	Assessment
	No substantial impact to either soil-vapour or groundwater has been identified at the site. Where impacts exist, it is anticipated that they are limited to minor/localised soil hotspots. TRHs, BTEX, PAHs and Lead Similar to Option 1, several treatment technologies exist which are capable of removing and/or destroying the COPCs	The anticipated quantities of impacted soils, comprising minor and/or localised hotspots, does not warrant the logistical and energy investment required to export and reimport soils to the site.
	AEC 3 and AEC 4 COPCs: TRHs, PCBs, heavy metals, PAHs, BTEX, OCPs, VOCs and Asbestos Similar to Option 1, with the exception of Asbestos, these compounds are amenable to treatment.	AEC 3 and 4 COPCs: TRHs, PCBs, heavy metals, PAHs, BTEX, OCPs, VOCs and Asbestos All COPCs: Not the Preferred Option The anticipated quantities of impacted soils, comprising minor and/or localised hotspots, does not warrant the logistical and energy investment required to export and reimport soils to the site.
3. Excavation and off-site removal of the impacted soils.	All COPCs There are currently suitably licensed waste facilities in the Sydney Metropolitan region capable of accepting the identified contaminants.	All COPCs A potentially suitable option but inferior to Option 1, Option 2 and Option 4 where viable. The environmental impact of the transport of materials, waste generation and resource use in sourcing materials to re-instate the site to development levels is considered inconsistent with the principals of ecologically sustainable development. Whilst this method is viable from a technical and practical view point, as a result of resource consumption and waste generation volume considerations, this is not the most preferred remedial option available. However, where materials are identified as not being environmentally suitable under Option 1, Option 2 or Option 4, or surplus to construction requirements then this is the preferred option.
4. On-site *in-situ* management of the soil by physical separation, and ongoing management.	AEC 1 COPCs: Chlorinated ethenes (PCE, TCE and DCE) VOC impacted soils, based on the assessment to date **(Section 5** and **Section 6**), have been inferred to be the source of groundwater and soil-vapour impacts at the site. On this basis, VOC impacted soils are not suitable for retention on the site without treatment such that the VOCs are reduced to an acceptable level.	AEC 1 COPCs: Chlorinated ethenes (PCE, TCE and DCE) Not a suitable option.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Remedial Option	Applicability	Assessment
	AEC 2, AEC 3 and AEC 4 COPCs: TRHs, PAHs, Heavy Metals, OCPs, PCBs, VOCs and Asbestos Volatile COPCs (v-TRH, BTEX and VOCs) Where present, v-TRHs, BTEX and VOCs represent unacceptable migration risks and are not readily encapsulated by onsite retainment technologies. Non-volatile COPCs (sv-TRH, PAHs, heavy metals, OCPs, PCBs and Asbestos) Fill materials, based on the assessment to date (refer to **Section 5** and **6**), have been found to be largely free of constituents at concentrations which pose an unacceptable risk to future site users under the proposed development scenario. Notwithstanding, the potential for these constituents to be present in soils not yet assessed at the site exists. Assessment conducted hitherto has not identified potential impacts in soils: • That will pose a potential groundwater risk by the demonstrated absence of significant groundwater impact attributable to the site; and • That will pose a potential inhalation risk as demonstrated by the assessment of vapours. On this basis, the fill materials potentially contaminated by these compounds are likely to be suitable for retention on the site in areas where direct contact human/ecological exposures can be restricted. Where materials are identified as not being suitable for containment, Option 3 is the preferred remedial strategy.	AEC 2, AEC 3 and AEC 4 COPCs: TRHs, PAHs, Heavy Metals, OCPs, PCBs, VOCs and Asbestos Volatile COPCs (v-TRH, BTEX and VOCs) Not a Suitable Option Non-volatile COPCs (sv-TRH, PAHs, heavy metals, OCPs, PCBs and Asbestos) The preferred option. The retention of the materials will reduce the waste generation and resource requirements of the remediation of the site, as consistent with the ecologically sustainable development. The PCPV will be subject to significant areas of building and pavements which will provide physical separation between site users and retained impacted fill materials if present. This option is of highest ranking with respect to the ecologically sustainable development principles as a result of the low waste volumes and energy use. However, consideration of the practical implications of an ongoing site management is required prior to implementation where impacted materials are proposed to be retained.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.4 Proposed Remedial Approach

As shown in **Table 7.1**, with consideration to EPA (2017) hierarchy for remediation and the principles of ecologically sustainable development the remediation strategy for the proposed development is presented below.

- **AEC 1** – Delineate the extent of impacted soils via soil vapour assessment. Remove all impacted soils and local sewerage infrastructure servicing 134-138 and 140 Henry Street premises. Where onsite treatment is not viable or is unsuccessful, dispose of impacted soils to landfill.

  The anticipated maximum extent of impacted soils within the PCPV site is shown on shown on **Figure 6**. Soil impacts may extent north, into Henry Street, however this is outside of the PCPV project site. Based on the lateral extent occupied by 134-138 and 140 Henry Street, the anticipated maximum extent of VOC impacted soils which remediation is less than 1600 m^3.

- **AEC 2** – Ascertain whether UPSSs exist within 118-120 Henry Street.
  - If UPSSs are identified, remove to a disposal facility, assess surrounding soils to determine whether impacts are present. Excavate impacted soils (if present) and treat on-site. Where onsite treatment is not viable or unsuccessful, dispose of impacted soils to landfill;
  - If impacted soils are identified, excavate impacted soils and treat on site. Where onsite treatment is not viable or unsuccessful, dispose of impacted soils to landfill; and
  - If neither UPSSs or soils are identified, no remediation for AEC 2 required;

  The extent of potentially impacted media within AEC 2 is limited to soils in the vicinity of the UPSS (if present). Gross and/or widespread soil, groundwater and soil-vapour impacts within AEC 2 have not been identified.

- **AEC 3** and **4** – Ascertain whether residual soil impacts exist underlying current buildings/transformers (per **Section 7.6.3**).
  - If impacts are identified, preferentially retain the material onsite under a suitable cap covering to preclude future direct contact by human and ecological site receptors. Where onsite retention is not possible, or redevelopment works result in soils being surplus to development requirements, excavate impacted soils and dispose to landfill;
  - If no residual impacts are identified, no remediation for AEC 3 and AEC 4 is required.

If impacts are identified with AEC 2, AEC 3 or AEC 4 which require onsite retention, the proposed physical separation arrangements, providing physical separation from retained fill are presented in **Sections 7.6.5** (landscaped areas) and **7.6.8** (road reserves/paved areas). Soils moved within the site will require a material tracking system to be implemented during works (as described in **Section 7.6.12**).

If volatile contaminant impacts are identified within any of AEC 2, AEC 3 or AEC 4 during remediation works, potential for the generation of vapours needs to be assessed to determine whether implementation of a 'cap/cover' remedial strategy as indicated in ANZECC (1999), in conjunction with appropriate control measures, is appropriate with respect to management of the health risk.

7.5 Regulatory and Planning Requirements

The following planning requirements for the proposed remedial works are presented.

Environment Planning and Assessment Act 1979/SEPP 55

Under Clause 9 (d) of SEPP 55, remediation work is considered Category 1 remediation work (i.e., requiring development consent) when the development for which another State environmental

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

planning policy or a regional environmental plan requires development consent. The site is located within the boundary of the Sydney Regional Environmental Plan No. 20 – Hawkesbury-Nepean River (No .2 – 1997) (SREP20) and therefore any remediation works require development consent under SREP20. Clause 11 (4) of SREP20 requires consent for remediation.

On this basis, the proposed remedial works at the site are considered to be Category 1 Remedial Works (as per SEPP 55) and require consent.

The nature of remediation works is relatively well understood and it is considered most appropriate that development applications for remediation works are included with DA documentation for the associated earthworks as ancillary to other development. Where development proceeds in stages, which preclude readily completing concurrent remediation and site redevelopment, a separate planning consent may be required to complete remediation of the site.

Environment Planning and Assessment Regulation 2000 – Schedule 3 Designated Development

The proposed remediation works do not constitute designated development. With reference to the triggers listed in Schedule 3, the following commentary is provided:

- Remediation of the site will not comprise treatment or storage of contaminated soil not originating from the site; Remediation will not affect an aggregate area exceeding 3 hectares;
- The proposed remediation works will not incorporate on-site treatment by any means of soil in exceedance of 30 000 m^3; and
- The proposed remediation works will not incorporate treatment by incineration of more than 1000 m^3

Protection of the Environment Operations Act 1997

All potential discharges from the site during remediation works will require to be maintained below applicable assessment criteria/threshold guidelines during the remediation works. This would apply to potential emissions in air, water and discharges to groundwater. Levels of discharges are typically assessed at a site boundary.

The proposed remediation/validation activities are not required to be licensed under the Protection of the *Environment Operation Act (1997)*. The site is less than 3 ha in area, does not store greater than 30 000 m^3 of contaminated fill and hence does not trigger the licensing requirements.

Water Management Act 2000

Should dewatering be required, a dewatering and potentially a re-injection approval will be required from the NSW Department of Primary Industry - Water (DPI-Water) for any dewatering proposed with the site works. The approval will require to be obtained prior to the undertaking of any groundwater dewatering and treatment. Depending on the depth of proposed basements, temporary dewatering may be required.

Protection of the Environment Operations (Waste) Regulation 2014

The regulations make requirements relating to non-licensed waste activities and waste transporting. The proposed works will not require to be licensed. Section 48 of the Reg. requires that wastes are stored in an environmentally safe manner. It also stipulates that vehicles used to transport waste must be covered when loaded. This regulation also details additional tracking requirements for vehicles carrying Special (Asbestos) waste.

Provision is provided in the Regulation and EPA (2014a) guidelines for the NSW EPA to approve the immobilisation of contaminants in waste (if required).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

It is noted that no waste will be received at the site and only VENM, excavated natural material (ENM) or materials covered by a NSW EPA exemption will be imported to the site.

Protection of the Environment Operations (Underground Storage Systems UPSS) Regulation 2014

The removal of UPSSs (if present) will be undertaken in accordance with WorkCover NSW requirements and a validation report will be provided in accordance with the provisions of the *Protection of the Environment Operations (UPSS) Regulation 2014*. The validation process in this RAP meets the requirements of the regulation.

Waste Classification Guidelines (EPA 2014a[19])

All wastes generated and proposed to be disposed off-site shall be assessed, classified and managed in accordance with this guideline. Where wastes require immobilisation prior to off-site disposal (to reduce waste classifications) an immobilisation approval shall be sought in accordance with Part 2 of this guideline. Immobilisations are only anticipated to be required with unexpected finds.

NSW Aquifer Interference Policy (NSW Office of Water 2012)

Groundwater underlying the site will potentially be classified as an aquifer as per the policy. The policy does not apply to the site development as any works proposed to be undertaken within the saturated portion of the site will not contaminate groundwater (as assessed by comparison to applicable standards and guidelines) and will not cause an unacceptable loss of storage or cause structural damage to the aquifer.

Penrith City Council 'Penrith Development Control Plan 2014'

The Council development control plan (DCP) provides a number of environmental and site management provisions required to be employed during remediation works. These have been incorporated into this RAP as minimum standards for the environmental management of remediation works.

Work Health and Safety Act 2017 No 10 and Work Health and Safety Regulation 2017

The information and data provided in this RAP should be considered by the Principal/Remediation Contractor in preparation of their health and safety plans for the remedial works.

7.6 Remedial Scope of Works

It is envisaged that remedial and validation works will be potentially conducted as a staged process as required for the site development. Within each proposed stage, remediation works will comprise, where appropriate the following actions.

7.6.1 Site Establishment

For each stage of remediation works the boundary will be defined (via survey) and secured as appropriate to ensure that all safety and environmental controls are implemented, including necessary contractor briefings and inductions for the remediation workforce. A summary of the controls is provided in **Section 10**.

7.6.2 Demolition of Overlying Buildings and Current Hardstands

Buildings and pavements currently present at the site are anticipated to be demolished to facilitate the proposed development. The demolition will expose underlying impacted soils and areas requiring additional assessment.

[19] Waste Classification Guidelines – Part 1: Classifying Waste. NSW EPA 2014 (EPA 2014a)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Premature exposure of impacted soils within AEC 1 may result in additional recharge (by rainfall or other surface water infiltration) through impacted unsaturated soils. Hardstand pavements overlying AEC 1 will be maintained in reasonable condition until the area is to be remediated.

7.6.3 Refine Remedial Extents

Subsequent to demolition of overlying buildings and hardstand pavements, formerly capped AECs will be exposed and available for additional assessment. The following assessment activities will be undertaken to refine the remedial extent:

- **AEC 1**: Remedial extents for AEC 1 will be refined in accordance with the following program:
  - A Vapour Sampling, Analysis and Quality Plan (VSAQP) will be prepared to inform the requirements of the relevant RWP(s). The VSAQP will stipulate the requirements of a soil-vapour screening assessment on an approximate 5 m grid within the footprint of 134-138 and 140 Henry Street. The soil vapour assessment will be undertaken by installation of temporary multi-level soil vapour probes. Probes will be screened onsite with a compound specific GC-PID, and subsequent confirmatory sampling/analysis using a carbon tube methodology, to determine the extent of impacted soils generating unacceptable concentrations of soil-vapour contamination. The anticipated remedial extent will be informed by trigger levels derived through a development specific risk assessment;
  - Where building development potentially includes multilevel basements, delineation of deep soil-vapour impact extending east of AEC 1. Determination will be made based on the location of proposed basements and relative distance to identified soil-vapour/groundwater impacts and requirements for remediation/management and validation will be included in the relevant RWP(s).
- **AEC 2:** upon demolition of the overlying building at 118-120 Henry Street, assessment for the potential presence of UPSSs will be undertaken. Inspection of the ground surfaces for fill/vent points and scanning with a Ground Penetrating Radar will be undertaken. Fill material will be assessed for the presence of potential petroleum hydrocarbon related impacts by collection and laboratory analysis of samples from four locations across the property as collected via test pit excavation methodology;
- **AEC 3:** Soils underlying current transformers will be assessed by collection/analysis of soil samples. Where no indicators of contamination (staining, odours, free oils, etc.) are identified, one sample is proposed to be analysed from soils with anticipated highest probability of impact underlying each transformer. Should gross indicators of impact be identified, or preliminary results identify contaminated soils, further sampling analysis will be required to determine the extent of impact/remediation. Samples will be assessed for TRHs and PCBs; and
- **AEC 4**: The site fill material has been broadly characterised, however limited site access has precluded assessment of soils underlying current buildings. Soils underlying current buildings will be assessed for the presence of COPCs via test pits. The required number of test pit locations for each building is presented following:
  - Lot 1 DP 526304, Lot E EP 163176, Lot 2 DP 556075 – one location;
  - Lot 11 DP 556665 and Lot 1 DP 164798 – two locations; and
  - Lot 10 DP 553665, Lot 1 DP 113118 and Lot 1 DP 545578 – four locations.

  Test pits will be advanced to a depth of at least 0.5 m into undisturbed natural materials. Soil samples will be collected from fill material analysed for a range of COPCs (**Table 6.1**). Where elevated total soil concentrations are identified, leachate samples will be prepared to determine whether any risk to groundwater is present.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.6.4 Excavation of Impacted Soils

Soils within the footprint of 134-138 and 140 Henry Street and any soils identified as exceeding validation criteria (as derived in the VSAQP or generic criteria presented herein i.e. NEPC (2013)) are required to be excavated and separated from the balance of the site fill materials/natural soils. The inferred extent of the dry-cleaner remediation area is shown on **Figure 6**.

VOC impacted fill material will be refined by future pre-remedial investigation works advised by VSAQP. Upon excavation to the inferred remedial extent, confirmatory field screening and laboratory analysis of soil-vapour will be undertaken to ensure that unacceptable levels of soil-vapour contamination are not present within the residual soils, with risk-based action criteria provided in the VSAQP. Excavated fill materials will be temporarily stockpiled. Stockpiling shall be undertaken to restrict potential environmental emissions in accordance with the requirements of the REMP as discussed in **Section 10**.

The volume of potentially impacted shallow sub-surface soils (based on distance between vapour samples with no HIL-B/HIL-C soil-vapour exceedances, and an average depth of impact of 2 m) is estimated to be 1600 m^3.

Deep soil vapour impact has been identified offsite however the general absence of sub-slab vapour contamination (as evidenced by JBS&G (2019a)) indicates that deep sub-slab vapour contamination is not migrating to the ground surface. Potential migration of vapours back onto the site upon removal of impacted site soils will be considered where basements are proposed per the data gaps discussed in **Section 6.7** and as part of the validation process discussed in **Section 8**.

Petroleum hydrocarbon or other impacted soils (if identified) will be remediated as discussed below or removed from the site to a facility lawfully able to accept the material.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.6.5 Treatment of Chlorinated and Petroleum Hydrocarbon Impacted Soils

Chlorinated ethene impacted soils and, if identified during remedial extent refinement, petroleum hydrocarbon impacted soils shall be treated within the site, where practicable. Treatment will be undertaken by bioremediation and/or compound removal as conducted within biopiles.

Compound removal is completed by stripping chlorinated ethenes from soil surfaces and adsorption of compounds on to an adsorptive media (e.g. activated carbon). Bioremediation is stimulated by increasing oxygen content within the soils to cause aerobic decomposition of petroleum hydrocarbons. Bio-piles will be constructed and operated in a manner that achieves the bioremediation outcomes for the soils while eliminating the potential for environmental emissions. Bio-piles shall be constructed and operated as per the following general specifications:

- Bio-piles shall not exceed 2 m in height;
- Bio-piles shall be provided with screened/slotted piping (i.e. ag line or similar) throughout the stockpiled material. Piping shall be provided at a typical 0.5 m spacing throughout the bio-pile and screened/slotted sections shall be covered by soils within the stockpile;
- Air shall be drawn through the slotted pipes. This causes air to be drawn into the bio-pile and air emissions from the bio-pile (which is anticipated to be malodorous) to be received at a common discharge point; and
- Air emissions shall be filtered through a granular activated carbon (GAC) filter prior to discharge to the atmosphere.

The bio-pile will be covered. The bio-pile will require to be periodically watered to maintain moisture conditions within the soils for bio-remediation. The GAC filter shall be sized on the basis of the size of the bio-pile and observation of emissions from the GAC filter. Where malodorous emissions are observed through the GAC filter, additional filter media shall be required.

Treatments works are required to be undertaken in accordance with *Best Practice Note: Landfarming, NSW, EPA* 2014b. Specific details of the treatment methodology, associated controls and required validation will be provided in relevant RWP(s).

Where the practicality of landfarming is hindered by redevelopment specifics (timing, available space, community objection, etc.) then impacted soils will be disposed of from the site to landfill. Details of the contingency will be provided in the relevant RWP(s).

7.6.6 Physical Separation

If non-leaching/non-volatile soil contamination is identified during remedial extent refinement, the impacted soils will be preferentially retained on site. If the soils are demonstrated as being suitable for retention on site subject to removal of direct contact exposure, then the following procedure will be implemented.

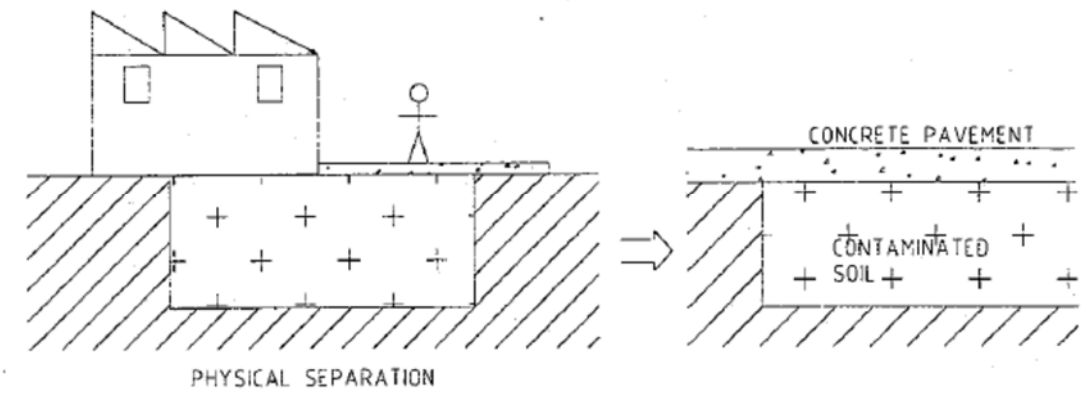
The principal of the on-site management approach within the site is to retain materials in-situ by providing physical separation between impacted fill/soil materials and receptors (e.g. site users, flora or fauna). The management approach prevents direct contact via permanent pavements/minimum soil thickness arrangement (i.e. physical separation), and implementation of a long-term EMP to maintain the physical separation arrangements.

The minimum typical requirements in ANZECC (1999) for physical separation include:

- Permanent concrete floor slab or asphalt surfaced pavement. The pavement outside of the building footprint shall be underlain by a marker layer; or
- A thickness of soil that is unlikely to be penetrated by future users of the site. A minimum soil cover thickness of 0.5 m is nominated as underlain by a layer of ‘marker layer’ in areas of exposed site soil (i.e. landscaped beds and parklands).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

As shown schematically below:



Source: ANZECC (1999)

The marker layer shall consist of orange geofabric. The specific details of the marker layer will require to be included in the validation report and long-term EMP documents in addition to plans showing the extent of capped area within the site.

Material above the marker layer extending to the final finished ground level will be required to be environmentally suitable material for human and/or ecological exposure (as appropriate). These physical separation arrangements shall generally comprise growing media, but may potentially comprise material originating from within the site validated as suitable for reuse in accordance the requirements outlined in **Sections 8**; imported VENM or material certified in accordance with an exemption issued by the NSW EPA. Where materials are proposed for beneficial reuse under a NSW EPA exemption (i.e. imported to the site), fill material will need to be further assessed for land use suitability. Sampling densities and analysis for COPC will be dependent on the volume, material type, source and subject to Site Auditor endorsement and acceptance.

Installation of physical separation arrangements shall be defined by survey as completed by a registered surveyor and/or building as-built drawings sufficient to identify:

- The lateral extent and upper depth height of known environmentally impacted materials (i.e. residual fill materials underlying the cover) within each remediation area/stage;
- The lateral extent and type of cover (e.g. permanent pavement) within the remediation area/stage; and
- Confirmation, by photos or otherwise, of the installation of the 'marker layer' underlying the cover (as required).

A thicker cap may be required in areas of deep planting and/or service installation. Detailed cap construction requirements are required to be provided within relevant RWP(s).

7.6.7 Importation and Off-site Disposal of Fill Materials

Reference should be made to **Section 8** for sampling densities and analytes and compliance with relevant EPA made or endorsed guidelines.

7.6.8 Asbestos Management

Based on the available site characterisation information as discussed in **Section 5**, fill materials within the site have been assessed for the presence of asbestos in soils and have been found to be largely free from asbestos impacts. Notwithstanding, the potential for asbestos impacts to be identified in shallow fill materials upon demolition and removal of overlying hardstands. Given the identification of building and demolition wastes in fill across the site, and the identification of asbestos in soils at location JB11, fill material within the vicinity of this location (as shown on **Figure**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6) is required to be considered as potentially impacted with asbestos fibres, and are provisionally classified as asbestos contaminated soils in accordance with the Work Health and Safety Regulation 2017 until deemed otherwise.

Soil asbestos concentrations are not in exceedance of site suitability criteria, and remediation of soils to remove asbestos impacts is not required for the purpose of making the site suitable for the proposed development. Notwithstanding, management of asbestos is required during development works to ensure that workers and/or offsite receptors are protected.

Asbestos contaminated soil necessitating management for potential asbestos exposure is defined in *How to Manage and Control Asbestos in the Workplace Code of Practice*, 2016, Safe Work Australia/NSW WorkCover 2016 (SWA 2016/NSW WorkCover 2016) as:

- Soil that contains visible asbestos as determined by a competent person; or
- Soil that contains asbestos fibres at quantities exceeding trace levels (considered to be the analytical detection limit in lieu of alternate guidance) as reported by analysis undertaken in accordance with AS4964:2004 *Method for the qualitative identification of asbestos in bulk samples*.

Environmental, health and safety management requirements for the handling of these materials will be based on the requirements provided for asbestos-related works in SWA 2016/NSW WorkCover 2016. This will include preparation of an asbestos register and associated asbestos removal control/management plan as outlined in SWA 20161/NSW WorkCover 2016.

Where sampling and analysis of specific fill materials is completed in conjunction with inspection by a competent person, and the results indicate the material does not fall within the “asbestos contaminated soil” definition, the requirements for management of “asbestos contaminated soils” will not be required to be implemented. The extent of asbestos contaminated soils may be further delineated within a work stage by a similar assessment (i.e. identification of asbestos contamination hotspots).

For the purposes of remediation works within the site, a competent person shall be considered to be a person who holds a tertiary degree in an environmental discipline, has experience in contaminated site assessment and has completed a WorkSafe approved Asbestos Removal Supervisor course.

7.6.9 Movement of Material

Movement of materials will be required at the site and shall be moved as per a material tracking plan as documented following. The tracking system is designed to track the quantity and quality of materials from their arrival on site or their derivation point, through temporary storage to placement.

The system comprises the following elements;

- Definition of Roles and Responsibilities;
- Material quality information;
- Material movement tracking;
- Material emplacement;
- Documentation required;
- Dealing with non-conformance; and
- Dealing with expected and unexpected finds.

7.6.9.1 Roles and Responsibility

The Principal Contractor will be responsible for the following:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Implementation and overall management of onsite procedures and protocols defined in the RAP document.
- Responsible for ensuring all subcontractors and consultants employed in reuse material classification generation, movement and placement are adequately briefed in the requirements of the RAP.
- Will take ultimate responsibility for the movement and placement of materials intended for reuse.
- Will ensure clear lines of communication are maintained between all relevant responsible parties.
- Will be responsible for liaison with suppliers in sourcing of materials from offsite, whether imported VENM or material under a NSW EPA exemption.
- Responsible for ensuring the RAP is operated effectively in conjunction with other relevant documents and in line with the overarching Health, Safety and Environmental Plan, Asbestos Management Plan to be developed for the site.

Environmental Consultant will be responsible for the following:

- Liaise with the Principal Contractor with regards to the importation of materials which does not meet the definition of VENM to ensure materials meet the project requirements and to prevent unsuitable materials being inadvertently brought onto the PCPV, such that the site cannot be validated as suitable for proposed permissible uses.
- Undertake inspections when material importation works are being undertaken to confirm materials sampled are consistent with those being imported.
- Review materials tracking documents submitted by the Principal Contractor and investigate/resolve any discrepancies.
- Cross check inspection findings with materials tracking sheets.
- Provide directives (decisions) relating to a proposed and/or placed fill materials suitability.

7.6.9.2 Material Tracking

The movement of classified materials within the site will be controlled by an appropriately managed Materials Tracking System, as discussed below.

In order to minimize double handling on the site, improve cost effectiveness and reduce environmental impacts, every effort should be made to facilitate the movement of excavated or imported material directly to the area of placement.

It is, however, recognized that this objective may not always be practical and hence the following range of potential material movements is anticipated:

- Stockpile to Placement;
- Import to Emplacement;
- Import to Stockpile;
- Stockpile to Stockpile; and
- Offsite disposal.

7.6.9.3 Materials Characterisation Form

All material movements within the site will be controlled using Materials Classification Forms (MCF) and Material Tracking Sheets (MTS).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Each MCF outlines procedures for confirming material quality, quantity and summarising existing analytical data. The MCF will be completed by the Principal Contractor and/or the Civil Works Contractor and will include the following:

- A unique MCF document name/number;
- A summary of VENM/ENM reports prepared the Environmental Consultant;
- Materials description; and
- Material reuse suitability summary.

Each MCF will be completed and signed off by the Principal Contractor/Civil Works Contractor based on material characterisation reports prepared by Environmental Consultant. Once completed, the MCF will be incorporation into the Principal Contractors materials tracking system prior to placement within the site.

An example of the MCF is presented in **Appendix F**.

7.6.9.4 Materials Tracking Sheet

The MTS is a two-part document which requires information to be collected at the material source location and at one of the three potential destination sites. An example of the MTS is presented in **Appendix D**.

All MTSs will be uniquely referenced and stored as a record of material movements.

This first part (Part A) of the document will record the following data:

i. Time and Date
ii. Truck registration or plant identification;
iii. Load quality; and
iv. MCF reference name/number. The MCF will provide details on items such as a source location reference, visual/olfactory observations, materials classification/reuse zone suitability summary.

The document will also be used for materials required for onsite placement or temporary stored prior to placement and will be completed at the point of unloading. The sheet will record the following details:

- Items i, ii, iii, as above;
- Visual and olfactory observations; and
- Zone of emplacement.

The final portion of the sheet (Part B) will be completed for materials which cannot be used within the site and are scheduled for off-site disposal in accordance with EPA (2014).

Items I, ii, iii and iv above will be recorded initially. The name of the haulage company responsible for transferring the material to the tip site and the details of the receiving site must also be recorded. Prior to leaving the site, the material should have undergone a waste classification in accordance with EPA (2014) and confirmation of this should be acknowledged on the sheet.

Finally, a note should be made of the consignment note number or receipt identification obtained.

The MTS will be reviewed and signed off as completed by the Principal Contractor and or Civil Works Contractor.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.6.9.5 Material Placement

Zones (grid references) of material placement will be accurately surveyed. This will allow the interrogation of the data set to ensure reuse material loads have been correctly deposited and a record kept of cumulative loads deposited in any particular zone.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8. Validation Plan

8.1 Overview

Validation data is required to be collected to verify the effectiveness of the remedial works and document the final site condition as being suitable for the proposed future use(s).

The following sections establish the DQOs to be adopted during validation of the remediation works.

8.2 State the Problem

The site, which has historically been used for commercial/industrial activities, is proposed to be redeveloped for mixed use (residential, public open space and commercial land uses).

Past assessment activities, as summarized in JBS&G (2017 and 2019a) and **Sections 5** to **7**, have identified that, prior to redevelopment, remediation of contamination is required.

During remediation activities, sufficient validation data is required to demonstrate that the identified environmental and health risks to future user(s) of the site have been adequately managed to render the site suitable for the proposed land use.

8.2.1 Identify the Decision

The decisions which are required to be made for validation of the site are:

- Have all VOC impacted soils representing a potential unacceptable human health/ecological risk been successfully treated/removed from the site?
- Where assessment of AEC 2 (former service station), AEC 3 (transformers) and AEC 4 (fill material) have identified residual, localised contamination:
  - Has all petroleum infrastructure and associated contaminated soils representing a potential unacceptable human health/ecological risk under the proposed development scenario been successfully treated/removed from the site?
  - Has all contaminated fill material which represents a potential unacceptable human health/ecological risk with respect to the proposed development scenario been successfully treated/removed from the site?
- Where impacted material which is demonstrated as being environmentally suitable for retention on site under a cap/cover physical separation, have marker layer and physical separation arrangements been installed appropriately and in accordance with RAP requirements?
- Are accessible soils ecologically suitable?
- Are imported soils (where required) ecologically suitable for their proposed use?
- Are offsite concentrations of chlorinated ethenes in groundwater stable or decreasing?
- Is an EMP required to address management of any residual contamination?
- Is the site suitable for the proposed use?

8.2.2 Identify Inputs to the Decision?

Inputs to the decisions are:

- All available site characterisation data collected up to the completion of site validation.
- Field observations in relation to inspection of all excavation bases, walls and stockpiles for odours, sheen, discolouration, and other indicators of potential contamination;
- Ground Penetrating Radar (GPR) survey information;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Soil and soil-vapour validation analysis data collected from stockpiles and the base and walls of remedial excavations;
- Groundwater validation analytical data collected from monitoring wells installed within and nearby to the site;
- Waste classification and/or material characterisation data obtained during assessment of fill materials/soils;
- Materials tracking records;
- Importation characterisation assessments;
- Disposal dockets and relevant documents in relation to appropriate disposal of material to be removed from site as part of the remediation works (landfill dockets, tank destruction certificates, beneficial reuse/recycling dockets, etc.);
- Survey data in areas of fill retention;
- Survey data as to the extent and thickness of physical separation arrangements and extent of environmentally impacted materials; and
- Data quality indicators as assessed by quality assurance/quality control (QA/QC).

Specifically, sufficient data needs to be collected from each of the identified potentially impacted media (e.g. soils, groundwater and soil-vapour) across the site to demonstrate that the associated COPCs (**Section 7**) have been removed or reduced to an acceptable level.

8.2.3 Define the Study Boundaries

The site comprises 10 legal properties (**Table 3.1**) and occupies an area of approximately 1.87 ha as shown on **Figures 1** to **4**. The study boundary extends north of the site, the final extent of which will be subject to future assessment works, to determine potential offsite migration of impacts. The surrounding land uses of the site is bound by Henry Street, Allen Place, Station Street and Woodriff Street North.

The vertical extent of the works will be the maximum depth from which impacted soils will be excavated/treated.

Validation works will be completed within development timelines to be informed upon development of detailed design proposals.

8.2.4 Develop a Decision Rule

Decision rules are provided following for each of the decisions:

- Have all chlorinated ethene impacted soils representing a potential unacceptable human health/ecological risk been successfully treated/removed from the site?
    - If all chlorinated ethene impacted soils representing an unacceptable risk to future receptors underlying 134-138 and 140 Henry Street have been removed/treated, the removal confirmed by comparison of soil leachate (against screening criteria from ANZAST 2018 95 % and NHMRC 2017 recreational exposure values) and soil-vapour analytical results against the interim soil vapour health investigation levels for volatile organic chlorinated compounds (NEPC 2013) and soils have been disposed of in accordance with EPA waste guidelines or been assessed as suitable for retention following remediation then the decision will be Yes. Otherwise the decision will be No and additional assessment and/or remediation will be required to demonstrate the objectives of the RAP have been achieved;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Where assessment of AEC 2 (former service station), AEC 3 (transformers) and AEC 4 (fill material) have identified residual, localised contamination:
  - Has all petroleum infrastructure and associated contaminated soils representing a potential unacceptable human health/ecological risk under the proposed development scenario been successfully treated/removed from the site?
    - If all petroleum hydrocarbon contaminated soils have been removed/treated, the removal/treatment confirmed by assessment of residual soil COPC concentrations and the NEPC (2013) criteria, and soils/infrastructure have been disposed of in accordance with EPA waste guidelines or been assessed as suitable for retention following remediation then the decision will be Yes. Otherwise the decision will be No and additional assessment and/or remediation will be required to demonstrate the objectives of the RAP have been achieved;
  - Has all contaminated fill material which represents a potential unacceptable human health/ecological risk with respect to the proposed development scenario been successfully treated/removed from the site?
    - If all contaminated soils have been removed/treated, the removal/treatment confirmed by assessment of residual/treated soil COPC concentrations and the NEPC (2013) criteria, and soils have been disposed of in accordance with EPA waste guidelines or been assessed as suitable for retention following remediation then the decision will be Yes. Otherwise the decision will be No and additional assessment and/or remediation will be required to demonstrate the objectives of the RAP have been achieved;
- Where impacted material which is demonstrated as being environmentally suitable for retention on site under a cap/cover physical separation, have marker layer and physical separation arrangements been installed appropriately and in accordance with RAP requirements?
  - The marker and physical separation arrangements must be installed across the extent of the impacted soils. The marker layer must be installed to the RAP requirements, as well as the manufacturer's installation requirements (**Section 8.2.6**). The vertical and lateral extents of the marker layer must be surveyed, along with consistent and comprehensive photographic evidence.
  - Where soil-based material is to be used for physical separation, placed above the marker layer and readily accessible to human users, this material is required to be validated as meeting the site validation requirements as discussed in **Section 8.7**.
  - All imported materials to be used as the physical separation arrangement must be environmentally suitable, as defined below. Growing media should have levels of constituents consistent with ecological protection criteria for 'urban residential and public open space' as provided to NEPC (2013).
  - If the marker layer and physical separation arrangements have been installed with the requirements of the RAP, then the answer will be Yes. Otherwise the decision will be No and additional assessment and/or remediation is required to demonstrate the objectives of the RAP have been achieved.
- Are accessible soils ecologically suitable?
  - If concentrations of COPCs in soils proposed to be used for establishment of site vegetation are below EIL/ESL criteria, the answer to the decision is yes.
- Are imported soils (where required) ecologically suitable for their proposed use?

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- If imported soils are comprised of VENM or ENM and they are used in accordance with the relevant exemptions, and analyte levels within the soils meet all the adopted ecological and human health criteria (**Section 8.5**) for accessible soils on the site then the decision will be Yes. Otherwise the decision will be No.

- Subsequent to the removal/treatment of chlorinated ethene impacted soils are groundwater chlorinated ethene concentrations stable/decreasing?
  - If an assessment of the attenuation of groundwater VOC concentrations demonstrated by either direct measurement of decreasing concentrations, or stable concentrations and secondary indicators of attenuation, then the answer to the decision was Yes. If No, further remediation/ongoing monitoring may be required to address outstanding contamination issues.
- Subsequent to the removal/treatment of chlorinated ethene impacted soils, and establishment that groundwater chlorinated ethene concentrations are stable/decreasing, do residual offsite concentrations of groundwater represent an unacceptable risk to sensitive downgradient receptors?
  - If assessment of the groundwater (by either site specific risk assessment and/or delineation of the plume extent) indicate that no potentially unacceptable risks are posed to sensitive downgradient receptors, the answer to the decision is No. Otherwise further remediation/ongoing monitoring may be required to address outstanding risks.
- Is an EMP required to address management of any residual potential contamination?
  - Was the answer to any of the above decisions No, or were any contaminated fill materials retained on site below a marker layer? If Yes, the issues are required to be documented within an EMP to be prepared for the site to address outstanding contamination issues. If No, an EMP is not required to be prepared for the site to address outstanding issues.
- Is the site suitable for the proposed use?
  - Was the answer to any of the above decisions No? If No, were the outstanding issues appropriately addressed by implementation of an EMP to the satisfaction of the auditor?
  - If the answer to the first question was Yes, or if the issues were appropriately addressed by an EMP, the answer to the above decision will be Yes. Otherwise, the answer to the decision will be No and additional remediation/management will be required.

8.2.5 Specify Limits of Decision Error

This step is to establish the decision maker's tolerable limits on decision errors, which are used to establish performance goals for limiting uncertainty in the data. Data generated during this project must be appropriate to allow decisions to be made with confidence.

Specific limits for this project have been adopted in accordance with the appropriate guidance from the NSW EPA, NEPC (2013), ANZECC (2000), DEC (2007[20]), appropriate indicators of data quality (DQIs used to assess QA/QC) and standard JBS&G procedures for field sampling and handling.

To assess the usability of the data prior to making decisions, the data will be assessed against pre-determined DQIs for completeness, comparability, representativeness, precision and accuracy.

The pre-determined Data Quality Indicators (DQIs) established for the project are discussed below in relation to precision, accuracy, representativeness, comparability, completeness and sensitivity (PARCCS parameters), and are shown in **Table 9.1**.

[20] *Contaminated Sites: Guidelines for the Assessment and Management of Groundwater Contamination*. NSW Department of Environment and Conservation 2007 (DEC 2007)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- **Precision** - measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** - measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** –expresses the degree which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the site, and by using an adequate number of sample locations to characterise the site to the required accuracy.
- **Comparability** - expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples; ensuring analysing laboratories use consistent analysis techniques and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** – expresses the appropriateness of the chosen laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted criteria.

If any of the DQIs are not met, further assessment of the data set will be required in order to determine whether the non-conformance has significant effects on the usefulness of the data. Corrective action to correct an adverse impact on the reliability of the dataset may include, but is not limited to, the request of further information from samplers and/or analytical laboratories, downgrading of the quality of the data or alternatively, re-collection of the data.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 8.1: Summary of Quality Assurance / Quality Control Program

Data Quality Objectives	Frequency	Data Quality Indicator
Precision		
Blind duplicates (intra laboratory)	1 / 20 samples	<50 % RPD[1], asbestos in agreement
Blind duplicates (inter laboratory)	1 / 20 samples	<50 % RPD[1], asbestos in agreement
Laboratory duplicates	1 / 20 samples	<50 % RPD[1], asbestos in agreement
Accuracy		
Surrogate spikes	All organic samples	70-130 %
Laboratory control samples	1 per lab batch	70-130 %
Matrix spikes	1 per lab batch	70-130 %
Representativeness		
Sampling appropriate for media and analytes		-[2]
Samples extracted and analysed within holding times.	-	Soil: organics (14 days), inorganics (6 months) Groundwater: metals (6 months, other than mercury - 28 days), sVOCs (>C_{10} - 7 days), volatiles (<C_{10} - 14 days) Soil vapour: sorbent tubes VOCs/TRH (28 days)
Trip spike (soil and groundwater only)	1 per sampling event	70-130 % recovery
Storage blank (soil and groundwater only)	1 per sampling event	<LOR
Rinsate blank (soil and groundwater only)	1 per sampling data where reusable equipment is used	<LOR
Method blank (soil vapour only)	1 per lab batch	<LOR
Trip blank (soil vapour only)		
Laboratory blanks	1 per lab batch	<LOR
Comparability		
Standard operating procedures for sample collection & handling	All Samples	All samples[2]
Standard analytical methods used for all analyses	All Samples	All samples[2]
Consistent field conditions, sampling staff and laboratory analysis	All Samples	All samples[2]
Limits of reporting appropriate and consistent	All Samples	All samples[2]
Completeness		
Sample description and COCs completed and appropriate	All Samples	All samples[2]
Appropriate documentation	All Samples	All samples[2]
Satisfactory frequency and result for QC samples	All QA/QC samples	-[2]
Data from critical samples is considered valid	-	Critical samples valid[2]
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted site assessment criteria	All Samples	All samples

[1] If the RPD between duplicates is greater than the pre-determined data quality indicator, a judgment will be made as to whether the excess is critical in relation to the validation of the data set or unacceptable sampling error is occurring in the field.

[2] A qualitative assessment of compliance with standard procedures and appropriate sample collection methods will be completed during the DQI compliance assessment.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8.2.6 Optimise the Design for Obtaining Data

The validation sampling design is summarised for each specific type of validation works as follows.

8.2.6.1 Validation of Chlorinated Ethenes in Soil and Soil-vapour

Soil Excavation Validation (Vapour)

The required remedial excavation extent will be informed by the VSAQP. Validation of the removal of soils with unacceptable levels of chlorinated ethene soil/soil-vapour concentrations will be conducted in accordance with the procedure presented following. Validation of chlorinated ethene impacted soil removal will require demonstration that residual soils do not result in unacceptable contaminated soil-vapour or leachate generation. Action criteria for soils will be derived within the VSAQP and presented in the relevant RWP(s) and shall be based on site development specific considerations: soil characteristics, backfill characteristics, depth of samples below finished levels, anticipated contaminant transformation/attenuation, rainwater infiltration, etc.

Inspection and sampling of excavations following removal of shallow fill will be required to confirm the absence of residual infrastructure or impacted soils which may result in unacceptable soil vapour concentrations. Where residual impact which may result in unacceptable soil-vapour generation remains (identified via visual/olfactory indicators, field screening or laboratory analysis)), these materials will be further chased out prior to backfill.

Field screening for unacceptable soil-vapour generation potential will be completed in accordance with the following methodology:

- Inspection of residual soils exposed on the excavation surfaces to identify visual or olfactory indicators of residual impact;
- Installation of temporary soil vapour probes or shallow soil vapour wells (per procedure presented in **Section 8.5**);
  - 1 temporary soil vapour probe per 5 m of excavation wall, with a minimum of one per wall; and
  - 1 temporary soil vapour probe per 25 m^2 of excavation base, with a minimum of four per excavation.
- Soil sample locations from the walls of excavations formed by the removal of impacted soils at a frequency of one sampler per 5 m of excavation wall, with a minimum of one per wall and 1 per 25 m^2 from the base of the excavation, with a minimum of four samples.

Installed probes shall be left to equilibrate (30 minutes for spear point or similar probes and 24 hours for soil vapour wells, in accordance with NEPC (2013) requirements) and then soil-vapour samples extracted. Soil vapour samples will be extracted from the temporary probes and analysed (either in field by portable gas-chromatography or by laboratory analysis). Determination of excavation extent acceptability will be made based on comparison of residual soil vapour sample concentrations with action criteria derived in the VSAQP and presented in the relevant RWP(s)**.**

Soil and soil-vapour validation will be analysed for concentrations of TRHs and VOCs. Soil samples will be subjected to ASLP and the resulting leachate fluid analysed for concentrations of CEs to assess the potential for leachate generation. Soil-vapour samples will be compared against site validation criteria (i.e. NEPM 2013 HIL-B and HIL-C, **Section 8.7**) and soil leachate generation compared against groundwater screening criteria (i.e. ANZAST (2018) and NHMRC (2017)). Should exceedance of the screening criteria be identified, further assessment and/or remediation will be required.

Validation of Final Site Surface

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Upon backfilling the remedial excavation and establishment of approximate final site levels, the final site-surface vapour concentrations will require validation. It is anticipated that final site levels will comprise exposed soils/garden beds. On that basis, validation will require to be undertaken by installation of either permanent or temporary soil-vapour wells on an approximate 10 m grid across the remedial excavation footprint. The vapour probes shall be installed to target soils no deeper than 1 m below the final site levels.

A minimum of two rounds of soil-vapour sampling will be conducted per the requirements of the VSAQP. Samples of soil-vapour will be withdrawn from each soil vapour well and submitted for laboratory analysis. Determination of remedial success will be based on comparison of laboratory analytical results with validation criteria presented in the VSAQP and relevant RWP(s).

8.2.6.2 Validation of Petroleum Infrastructure Removal (if required)

Inspection of excavations following removal of petroleum infrastructure will require to be completed to confirm the absence of residual impact which may exceed the NEPC (2013) criteria. Where residual impact which may exceed the NEPC (2013) criteria remain (via visual inspection, olfactory detection and/or through the use of a PID assessment), these materials will be further chased out prior to validation sampling.

Subsequent to the removal of the petroleum infrastructure and associated backfill, validation requirements, consistent with NSW EPA (2014[21]) requirements shall include:

- Sample locations from the walls of excavations formed by the removal of USTs/backfill sands at the frequency of one sample per 5 m of excavation wall per identifiable stratum or 1 m in wall depth, with a minimum of one per wall;
- Sample locations from the base of excavations formed by the removal of USTs at the frequency of one sample per 25 m^2, with a minimum of two per former UST location;
- Discrete sample locations under other petroleum infrastructure (i.e. remote fill points, fuel dispensers). In the event that significant impacted soil volumes are removed from these areas, the adopted sampling frequency for excavation bases and walls following UST removal will be adopted; and
- Sample locations at a linear spacing of 5 m underlying pipelines.

Soil samples shall be analysed for TRHs, PAHs, heavy metals and VOCs and compared against NEPM (2013) site validation criteria **Section 8.7**.

8.2.6.3 Validation of Impacted Fill Management (if required)

Where residual fill impacts are identified (AEC 3 and AEC 4), they are required to be either removed or demonstrated as being suitable to remain on the site under the proposed development scenario (above or below a marker layer). Removal of soils is required to be undertaken to the top of unimpacted fill material, natural soils or a depth of 0.5 m where fill is to be capped *in-situ*.

Subsequent to the removal of impacted fill, validation requirements shall include:

- Sample locations from the walls of excavations formed by the removal of soils at the frequency of one sample per 5 m of excavation wall per identifiable stratum, with a minimum of one per wall; and
- Sample locations from the base of excavations formed by the removal of soils at the frequency of one sample per 25 m^2, with a minimum of one per excavation.

[21] *Technical Note: Investigation of Service Station Sites*. NSW EPA April 2014 (EPA 2014)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8.2.6.4 Installation of the Physical Barrier

Where residual contaminated fill, which exceeds criteria for land use but is determined to be suitable for retention under a cap, is required to be retained on site, installation of physical separation arrangements (within road reserves and landscape areas where fill removal is not possible/practicable) shall be defined by survey as completed by a registered surveyor and/or building as-built drawings sufficient to identify:

- The lateral extent and upper depth height of known environmentally impacted materials (i.e. residual fill materials underlying the cover) within each remediation area/stage;
- The lateral extent and type of cover (e.g. permanent pavement, soil thickness) within the remediation area/stage; and
- Confirmation, by photos or otherwise, of the installation of the 'marker layer' underlying the cover (as required).

Physical separation arrangement requirements (i.e. thickness etc.) are detailed in **Section 7.6.6**.

Validation of installation shall demonstrated by inclusion of the following information in the validation report(s):

- Photographic evidence of marker layer application;
- Survey plans including spot measurements of the upper depth of retained contaminated material, the final height of the cap and the lateral extent of the caped area(s); and
- Material characterisation and importation records to demonstrate that capping materials are environmentally suitable for the relevant purposes.

It is anticipated the following materials will be used within the road reserves and across the broader site:

Growing Media

Soils to be imported and used as growing media within the site shall be sampled at a rate of at least one sample per 100 m^3 with a minimum of three samples per source/end location. Samples shall be analysed for TRH, PAHs, heavy metals, (including As, Cd, Cr, Cu, Pb, Hg, Ni and Zn), OCPs, PCBs, asbestos, soil pH and CEC. The materials shall be further inspected for any aesthetic indicators of contamination.

Site sourced natural soils shall be analysed for heavy metals, TRH, VOCs, OCPs, PCBs, pH and CEC. In addition, assessment of the potential presence of aesthetic issues, including staining, discolouration and/or odorous soil conditions will be completed.

Visual inspection is required by the Environmental Consultant during placement to confirm the material is consistent with the material sampled at the source site. Copies of classification certificates and importation records are required to be kept for inclusion in the validation report(s)

VENM

VENM shall be as defined under the *Protection of the Environment Operations (POEO) Act 1997* and characterised by at least five samples per source site and one per 1 000 m^3 being collected if more than 10 000 m^3. Visual inspection is required by the Environmental Consultant at the source site to confirm the material is consistent with the definition of VENM. Copies of VENM certificates and importation records are required to be kept for inclusion in the validation report(s)

ENM

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Sampling and analysis is required to be undertaken as per the exemption (EPA 2014c[22]).

Visual inspection is required by the Environmental Consultant during placement to confirm the material is consistent with the material sampled at the source site. Copies of ENM certificates and importation records are required to be kept for inclusion in the validation report(s)All ENM samples are required to be assessed for the presence of asbestos in addition to the requirements of the ENM analytical suite (EPA 2014c)

Recycled Products

Sampling of materials as per an EPA exemption is required to be undertaken by the facility in accordance with the exemption. In addition, where materials are proposed for beneficial reuse under a NSW EPA exemption (i.e. imported to the site), fill material will need to be further assessed by The Environmental Consultant for land use suitability. Sampling densities and analysis for COPC will be dependent on the volume, material type, source and subject to Site Auditor endorsement. All samples are required to be submitted for analysis of asbestos in addition to other relevant COPCs.

8.2.6.5 Materials Classification for Offsite Disposal

Materials sampled for waste classification in accordance with EPA (2014a) shall be sampled at an appropriate rate to characterise the materials. Stockpiles will be sampled in accordance with NEPC (2013). If the stockpile is greater than 200 m^3 the sampling rate shall be determined by the Field Scientist on the basis of the volume of materials and any potential heterogeneity occurring within the materials.

Sampling of materials as per the ENM exemption (or similar) requires to be undertaken in accordance with the exemption.

Sampling of site materials as per a VENM classification will require the collection of at least 10 samples with one per 1 000 m^3 being collected if more than 10 000 m^3 has been removed.

Sampling of materials as per an EPA exemption is required to be undertaken by the receiving facility in accordance with the exemption. In addition, where materials are proposed for beneficial reuse under a NSW EPA exemption (i.e. imported to the site), fill material will need to be further assessed by The Environmental Consultant for land use suitability. Sampling densities and analysis for COPC will be dependent on the volume, material type, source and subject to Site Auditor endorsement.

8.2.6.6 Confirmation of Hydrocarbon Removal from Soils

All petroleum hydrocarbon impacted soils to be treated on site (refer to **Section 7.6.5**), will be sampled at a density of one sample per 70 m^3 (minimum three samples per stockpile) and submitted for relevant COPCs (**Table 8.2**).

The successful treatment of CE impacted materials will be informed by field screening of soil vapour levels within treated stockpiles. A temporary soil vapour probe will be driven 1 m into discrete stockpiles of material with a maximum volume of 50 m^3. A soil vapour sample will be withdrawn from the stockpile after an equilibration period of 30 minutes, and assessed either in the field by portable gas-chromatography or by laboratory analysis. Specific action criteria for CE impacted stockpile remediation will be derived in the VSAQP and presented in the relevant RWP(s).

Where soil-vapour criteria have been satisfied, the stockpiles will be sampled and analysed for the presence of soil-bound CEs. A minimum of three soil samples are required to be collected from at least 200 mm below the stockpile surface. If detections of soil-bound CEs are identified, subsequent leachate analysis will be conducted to determine whether the CEs present a potential groundwater

[22] *The Excavated Natural Material Order 2014*. NSW EPA dated 24 November 2014, NSW EPA 2014b

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

migration risk. Determination of suitability to be retained on site will be made by comparison of leachate data against criteria presented in **Section 8.7** (i.e. ANZAST (2018) and NHMRC (2017)).

8.2.6.7 Validation of Groundwater Impact Attenuation

At the commencement of soil remediation at 134-138 and 140 Henry Street, concentrations of VOCs in groundwater shall be monitored via groundwater monitoring events conducted on offsite wells existing (JBMW01, JMBW02, JBMW03, JBMW05, JBMW06 and JBMW07) biannually. Monitoring of offsite groundwater VOC concentrations will continue for a minimum of four sampling events or until stable/decreasing concentrations are determined by a statistical assessment using the Mann-Kendall test).

Groundwater validation samples will be assessed to the ANZAST (2018) and NHMRC (2017) validation criteria.

8.2.6.8 Validation of Groundwater Offsite Migration Risk

Sufficient assessment will be required to demonstrate that offsite groundwater impacts do not present an unacceptable risk to downgradient receptors. This may comprise risk based determination that identified concentrations do not represent an unacceptable risk at the receiving water body and/or nearby building basements or complete delineation of the CE plume.

As a minimum, confirmation of the groundwater flow direction and review of groundwater concentrations following validation of groundwater impact attenuation (**Section 8.2.6.7**). Further installation and sampling of groundwater monitoring wells may be required as part of this works, the details of which shall be confirmed following detailed development designs and included in future RWP(s).

8.2.6.9 Sampling Frequency

Table 8.2 summarises the required validation sampling frequencies

8.3 Soil Sampling Methodology

The soil sampling method shall be determined by the Field Scientist as consistent with the observations of the site sub-surface and appropriate to generate representative samples. The soil sampling method shall be consistent with the data quality indicators in **Section 8.2.5**.

Where sample locations are placed by boreholes, undisturbed samples, as collected by push tube or SPT sampler, are preferred where able to be effectively implemented. Otherwise samples may be recovered from solid flight augers or via use of an excavator/hand tools. Re-usable equipment shall require to be decontaminated between sampling locations.

8.3.1 Soil Sample Containers

During the collection of soil samples, features such as seepage, discolouration, staining, odours and other indications of contamination shall be noted on field reporting sheets/field logs.

Collected soil samples shall be immediately transferred to sample containers of appropriate composition (glass jars) fitted with Teflon sealed lids. 500 mL samples shall be additionally collected and placed in new zip lock bags where asbestos analysis is required. Sample labels shall record sample identification number and date and time of sampling. Sample containers shall be transferred to a chilled ice box for sample preservation prior to and during shipment to the testing laboratory. A chain-of-custody form shall be completed and forwarded with the samples to the testing laboratory, containing the following information:

- Sample identification;
- Signature of sampler;
- Date of collection;
- Type of sample;
- Number and type of container;
- Inclusive dates of possession; and
- Signature of receiver.

8.3.2 PID Screening

Soil samples will be screened during field works using a PID to assess the potential presence of VOCs including petroleum hydrocarbons. Samples obtained for PID screening will be placed in a sealed plastic bag for approximately 5 minutes to equilibrate, prior to a PID being attached to the bag. Readings will then be monitored for a period of approximately 30 seconds or until values stabilise and the stable/highest reading will be recorded on the field sample forms. The PID will be calibrated prior to the commencement of field works and then check readings will be completed on a daily basis during the field program using suitable calibration gas. If required, the PID will be re-calibrated during the field program in accordance with manufacturer's instructions.

A GC-PID will be used to analyse gas samples on the site for concentrations of specific CEs. The GC-PID will be calibrated against gas standards and will offer real time screening of soil-vapour impacts to assist in advancement of the remedial excavation. The specific action criteria for PID screening shall be detailed in a Vapour Validation Sampling, Analysis and Quality Plan (VSAQP) issued prior to or as part of the stage specific RWPs or separately to the site auditor.

8.4 Groundwater Sampling Methodology

Groundwater wells will be inspected prior to sampling to ascertain their condition and determine whether they're suitable for sampling. If the presence of excessive sediment is identified the wells should be purged and allowed to settle for a minimum of 5 days prior to sampling.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Each monitoring well will be gauged with an Interface Probe (IP) which can detect NAPLs. The groundwater at each well will then be purged with a QED low flow/micropurge submersible bladder pump, using fresh disposable bladders and low-density polyethylene tubing, to remove the standing water. During removal, physiochemical parameters (pH, electrical conductivity, dissolved oxygen, reduction-oxidation potential and temperature) will be monitored until stabilisation, consistent with the requirements of VIC EPA (2000[23]). Groundwater samples will be taken from the end of the disposable LDPE tubing after parameter stabilisation has occurred.

Collected groundwater samples will be immediately filtered (as necessary) and transferred to laboratory supplied sample bottles. The sample containers will be transferred to a chilled iced box for sample preservation prior to and during shipment to the testing laboratory. A chain of custody form will be completed and forwarded with the samples. Samples will be analysed in accordance with the laboratory schedule (**Table 7.3**).

8.5 Soil-vapour Assessment

8.5.1 Temporary Soil Vapour Probe and Soil Vapour Well Installation

Temporary probes and soil-vapour wells are required to be installed to a minimum depth, or penetration if installed into excavation walls, of 1.0 m.

Temporary Soil Vapour Probes

temporary soil vapour probe will be directly driven into the face of exposed soils at the excavation base or walls to the required penetration depth, either by hand or mechanically assisted, and allowed to sit for a minimum of 30 minutes prior to sampling. The probes may be withdrawn and reused subject to appropriate decontamination.

Stockpiles requiring soil-vapour assay will be assessed via spear probes.

Soil Vapour Wells

Where soil-vapour wells are to be used, boreholes will be advanced via hand auger or drill rig. 6 mm nylon tubing with a stainless steel tip will be installed to the depth of the borehole, which will then be backfilled with graded sand adjoining the base of the sample tube, overlain by a nominal thickness of powdered bentonite, and backfilled with grout/bentonite chips to create an air-tight seal at the surface. Soil-vapour wills will be left to equilibrate for a period of 24 hours prior to sampling.

8.5.2 Soil-vapour Sampling

PID screening will be utilised to screen for residual volatile impacts within remedial excavations and treated soils. Samples will be obtained via installation of temporary 'spear probes' or soil-vapour wells. Once the probes/wells have equilibrated for the required period (30 minutes for spear probes and 24 hours for vapour wells), the PID will be attached to sample tubing for a period of approximately 30 seconds or until values stabilise and the stable/highest reading will be recorded on the field sample forms.

Soil-vapour will be sampled in accordance with the following methodology:

- A multi-gas meter will then be used to purge each probe for a period of at least 5 mins. Gas readings will be monitored until oxygen and PID readings stabilise;
- Following this a leak detection evaluation will be completed via placement of an isopropyl alcohol-soaked rag over the top of the backfilled borehole to assess the potential occurrence of leaks whilst the gas detector is purging the sample point. Elevated PID readings on the

[23] *Groundwater Sampling Guidelines*. Victoria Environment Protection Authority, April 2000, VIC EPA (2000);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

gas detector will indicate a leaking probe. Any leaking probes will be required to be reinstalled and re-checked prior to sampling using the same method;

- Attach via use of silicon a carbon tube to the exposed temporary soil vapour probe tubing;
- Attach a calibrated low-flow pump (<0.2 L/min) to the carbon tube using additional section of 6mm Teflon tubing as required;
- Withdraw sufficient soil gas over the carbon tube to ensure required detection limits are met for relevant COPCs and submit tubes for analysis as per **Section 8.7**.

8.6 Laboratory Analysis

NATA accredited laboratories shall be used for all analysis of samples. Appropriate methods and LORs are required for comparison to relevant criteria. Laboratory methods and LORs are presented in **Table 8.2** below.

8.7 Validation Criteria

Determination that remediation of the site has been achieved will be completed in accordance with the validation criteria set below. Based on the proposed development details, in accordance with the decision process for assessment of urban redevelopment sites (EPA 2017) concentrations of contaminants in media shall be compared against relevant criteria presented in **Tables 8.6, 8.7** and **8.8** sourced from the regulatory guidance listed below.:

In addition to site media contaminant concentrations, the Environmental Consultant will require to consider the circumstances which would trigger an assessment of aesthetics in accordance with NEPC (2013) throughout remediation. Where the triggers are satisfied, aesthetic issues which trigger the requirement for assessment shall be considered by the Environmental Consultant and any further remediation/management requirements identified to the Remediation Contractor

Soil Validation Criteria

- Health based Investigation Levels (HILs) for residential with limited access to soils (HIL-B), recreational and public open space (HIL-C) and commercial/industrial land use (HIL-D) – NEPC (2013);
- Health Screening Levels (HSLs), both fine and coarse-grained soils, for petroleum hydrocarbons considering potential for vapour intrusion – NEPC (2013);
- As a conservative measure, generic and site specific ecological investigation levels (EILs) were derived through the added contaminant limits;
- Management Limits for TRH, both fine and coarse-grained soils, for residential/public open space and commercial/industrial land use – NEPC (2013); and
- Ecological Screening Levels (ESLs) for TRH fractions, BTEX and benzo(a)pyrene, both fine and coarse-grained soil, for residential/public open space and commercial/industrial land uses – (NEPC 2013);

Groundwater/Leachate Criteria

- Recreational Health and aesthetics-based criteria adopted from the *Australian Drinking Water Guidelines* – NHMRC (2017);
- Groundwater HSLs, both fine and coarse-grained soils for petroleum hydrocarbons considering potential for vapour intrusion – NEPC (2013); and
- 95 % protection of freshwater aquatic ecosystems from the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* – ANZAST (2018);

Soil-vapour Criteria

- Interim Soil-vapour Health Investigation Levels for Volatile Organic Chlorinated Compounds – NEPC (2013); and
- Soil Vapour HSLs for Vapour Intrusion – NEPC (2013).

Where there are no NSW EPA endorsed thresholds the laboratory LOR has been adopted as an initial screening value for the purposes of this assessment.

The specific requirements for this assessment shall be detailed in a the VVSAQP, either included within the stage specific RWPs or to be issued separately, to the Site Auditor subsequent to delineation of soil-vapour impact. The RWPs/VVSAQP will include PID action criteria to guide field screening assessment

Notes:

[1.] Guideline values presented are for Chromium (VI) in absence of total Chromium values. Where total Chromium results are elevated, samples will be analysed for Chromium (VI).

[2.] Guideline values are for inorganic mercury. Where elevated mercury concentrations are encountered and/or site information suggests the potential presence of elemental mercury and/or methyl mercury, consideration of applicability would be needed.

[3.] Carcinogenic PAHs calculated as per Benzo(a)pyrene Toxicity Equivalent Factor requirements presented in NEPC (2013)

[4.] Total PAHs calculated as per requirements presented in NEPC (2013).

[5.] Management Limits are based on coarse grained soil, with F1 and F2 concentrations inclusive of naphthalene and BTEX compounds. Management limits will only apply where long-term containment of impacted material is proposed.

[6.] Soil Health Screening Levels for Vapour Intrusion: Coarse Soils. Values presented are those for 0 to <1 m bgl as the most conservative level. Reference should be made to results tables for further detail of levels at greater depths. NL: Non-limiting.

[7.] Values for F1 C_6-C_9 are obtained by subtracting BTEX (Sum) from laboratory result for C_6-C_9 TRH.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8.7.1 Application of Soil Assessment Criteria

For soils proposed to be retained *in-situ* they are required to meet soil validation criteria. Soil validation criteria will apply to all soils proposed to be left at the site. The specific criteria for soils will depend on the ultimate placement location (within the proposed park, publicly accessible areas or within the high-density residential/commercial precinct) and whether any separation is proposed (above or below the marker layer) as per the following. It is noted that the following criteria are based on the anticipated site uses, where ground floor residential and/or sensitive commercial land uses (childcare centres) are proposed, more stringent soil assessment criteria may be required and should be stipulated in the relevant RWP(s).

- Soils validated *in-situ* or placed within the proposed park / green spaces are to be assessed against HIL/HSL-C, ecological and management limit validation criteria for recreational / public open space land uses;
- Soils validated *in-situ* or placed within the future commercial / residential precinct are to be assessed against HIL/HSL-D, ecological and management limit validation criteria for residential and commercial/industrial land uses.

Where elevated concentrations (exceeding investigation/screening levels presented in **Table 8.6** and **8.6**) of potentially leachable and/or volatile contaminants are identified, either further remediation of soils will be undertaken or subsequent assessment of for potential groundwater and soil-vapour generation is required:

- Elevated concentrations of potentially leachable contaminants in soils: samples with the highest reported concentrations are required to be submitted for Australian Standard Leachate Procedure (ASLP) and the resulting leachate analysed for concentrations of the identified contaminants. Leachate results will be screened against groundwater assessment criteria; and
- Elevated concentrations of volatile contaminants in soils: soil-vapour assessment is required to be completed on the residual soils in accordance with the methodology discussed in **Section 8.3.2**.

Where impacted soils are retained under a cap/cover, they are required to be assessed for potential groundwater and soil-vapour generation per the above procedure.

<u>Statistical Assessment</u>

For soils to be considered as having met the assessment criteria (i.e., not posing an unacceptable risk), the following assessment will be made:

Either:

- All contaminant concentrations were less than the adopted site assessment criteria,

Or:

- The upper 95 % confidence limit on the average concentration for each analyte (calculated for samples collected from consistent soil horizons, stratigraphy or material types) was below the adopted criterion;
- No single analyte concentration exceeded 250 % of the adopted criterion; and
- The standard deviation of the results was less than 50 % of the criterion.

In addition to the numerical criteria, the following visual observations will also supplemented the assessment process:

- No visible asbestos containing material in addition to laboratory analysis results; and

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Consideration was given to odorous or discoloured soils (caused by contamination).

8.7.2 Material Characterisation for Off-site Disposal

Where contaminated fill/soil is not suitable for onsite management or is surplus to construction requirements, materials are proposed to be remediated by off-site removal and disposal. Materials shall be classified in accordance with EPA (2014) *Waste Classification Guidelines* or an appropriate exemption as created under the *Protection of the Environment Operations (Waste) Regulation 2014*.

Given the identification of ash and slag inclusions in fill material samples with elevated total PAH and metal concentrations, the ash and slag inclusions are concluded to be a significant source of these contaminants. On this basis, it is appropriate to apply the associated NSW EPA general immobilisation approvals (EPA 1999[24] and EPA 2009[25]) when consideration is given to evaluating a waste classification(s) for material required to be excavated during the remedial works.

Material will require to be removed to a facility lawfully able to receive it.

8.7.3 Imported Materials

In accordance with current EPA policy, only material that does not represent an environmental or health risk at the receiving site may be considered for resource recovery. Imported materials will only be accepted to the site if they meet the restrictions placed on these materials and meet the definition of:

- Virgin Excavated Natural Material (VENM) as defined in the *Protection of the Environment Operations Act* (1997) Schedule 1;
- Excavated Natural Material (ENM) as defined in EPA (2014); or
- Recycled materials as per an EPA exemption.

All materials imported onto the site are required to be accompanied by appropriate documentation that has been verified by the appointed site contamination (environmental) consultant.

Sampling of materials as per an EPA exemption (recycled products) is required to be undertaken by the facility in accordance with the exemption. In addition, where materials are proposed for beneficial reuse under a NSW EPA exemption (i.e. imported to the site), fill material will need to be further assessed by The Environmental Consultant for land use suitability. Sampling densities and analysis for COPC will be dependent on the volume, material type, source and subject to Site Auditor endorsement.

8.7.4 Validation of Soil Placement Areas

Soils which are to be moved to another area of the site will be subject to the following data recording process for future reference purposes, and detailed in the MTP:

- A location plan of the placed materials with co-ordinates based on an agreed grid system (e.g., GPS or relative to the lot boundaries);
- The levels in m AHD of the base of the placement location(s) prior to the material placement;
- The levels in m AHD of the placement locations once all materials have been placed;
- The levels in m AHD of any defining layers; and

[24] *General Approval of the Immobilisation of Contaminants in Waste – Ash and Coal*. EPA 1999
[25] *General Approval of the Immobilisation of Contaminants in Waste – Metalurgical Furnace Slag*. EPA 2009

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Subsequently the total placed volume of materials.

8.7.5 Validation of Physical Separation

Qualitative review of documentation pertaining to the physical separation arrangements employed at the site will be undertaken to determine suitability for the intended purpose. Documentation will require to demonstrate, at minimum, the items identified in **Section 8.2.6.5.**

8.8 Reporting

At the completion of site remediation works, a validation report will be prepared in general accordance with EPA (2017) and OEH (2011) *Guidelines for Consultants Reporting on Contaminated Site*, documenting the works as completed.

This report will contain information including:

- Details of the area of the site which is subject to the validation assessment;
- Details of the remediation works conducted;
- Information demonstrating that the objectives of this RAP have been achieved, in particular the validation sample results and assessment of the data against both the pre-defined DQO and the remediation acceptance (validation) criteria;
- Clear statement that the remedial/validation works have been completed in accordance with the requirements of the RWP(s) and VSAQP;
- Information demonstrating compliance with appropriate regulations and guidelines;
- Any variations to the strategy undertaken during the implementation of the remedial works;
- Results of all environmental monitoring undertaken during the course of the remedial works;
- Details of any environmental incidents occurring during the course of the remedial works and the actions undertaken in response to these incidents;
- Verification of regulatory compliance;
- Details on waste classification, tracking and off-site disposal including landfill dockets;
- Clear statement of the suitability of the portion of the site which is the subject of the validation report, for the proposed use(s);
- Material tracking records which demonstrate that materials imported onsite and dispose offsite have been moved in accordance with relevant regulatory requirements; and
- Other information as appropriate, including details of EMPs (if required) that will apply to the part of the site that is the subject of the validation report.

The report will serve to document the remediation works for future reference.

Given the anticipated staged nature of site remediation, reporting, including preparation of RWP(s), EMP(s) and validation report(s) will also be staged.

8.9 Environmental Management Plan

Should validation of the site, or part thereof, identify that impacted material will remain upon completion of the works, collected data will be assessed in relation to the potential for implementation of an EMP for ongoing management of contamination risks. As per the DQO decision rule processes discussed in **Section 8**, the presence of soil impacted by contaminants of concern above the site criteria may trigger the requirement for an ongoing EMP.

Where required, the EMP shall contain the following elements:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- A statement of the objectives of the EMP – i.e., to ensure continued suitability of the site after it has been remediated;
- Identification of residual environmental contamination issues at the site that require ongoing management/monitoring to meet the EMP objectives, including the type of contamination and location within the site (including survey plans);
- Documentation of environmental management measures which have been implemented to address the identified environmental issues at within the site;
- Description of management controls to limit the exposure of the site users to known areas of contamination to acceptable levels;
- Description of responsibilities for implementing various elements of the provisions contained in the EMP;
- Timeframes for implementing the various control/monitoring, etc. elements outlined in the EMP;
- Environmental monitoring and reporting requirements (if required) for the future management of environmental impact underlying the site including:
    - Appropriate monitoring locations and depth within and down-gradient of any residual contamination;
    - Relevant assessment criteria to be used in evaluating monitoring results;
    - Frequency of monitoring and reporting;
    - Process for reviewing monitoring data and how decisions will be made regarding the ongoing management strategy;
    - The length of time for which monitoring is expected to continue;
    - The regulatory authorities involved and the management inputs required from each;
    - The integration of environmental management and monitoring measures for soil and groundwater;
    - Health and safety requirements for particular activities;
    - A program of review and audits;
    - The provisions in the EMP are feasible (i.e., able to be implemented) and able to be legally enforceable (i.e., a mechanism exists, such as development consent conditions, to give the plan a basis in law); and
    - The relevant consent authority is satisfied that the inclusion of a development consent condition relating to the implementation of the EMP is acceptable;
- Corrective action procedures to be implemented where EMP assessment criteria are breached.

The EMP will be provided to the appointed Site Auditor for review and approval prior to preparation of the SAS and SAR.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9. Contingency Plan

A review of the proposed contamination-related aspects of the works associated with development the site has been undertaken and has identified a number of potential risks, outlined in the following sections that required the development of contingencies to ensure that the objectives of this RAP are met.

The Contingency Plan is required to be part of the REMP, as described in **Section 10**, below, and part of the Work Health and Safety Plan (WHSP), as described in **Section 10**.

9.1 Unexpected Finds

The possibility exists for hazards that have not been identified to date to be present within fill materials or underlying pavements/building on the site. The nature of hazards which may be present and which may be discovered at the site are generally detectable through visual or olfactory means, for example:

- The presence of significant aggregates of friable asbestos materials (visible) as opposed to minor occurrences of fragments or fibre bundles in soil; and/or
- Excessive quantities of Construction/Demolition Waste (visible); and/or
- Hydrocarbon impacted materials (visible/odorous); and/or
- Drums, waste pits, former pipework or USTs (visible); and/or
- Oily Ash and/or oily slag contaminated soils/fill materials (visible/odorous); and/or
- Tarry like impacted soil/fill material (visible/odorous); and/or
- Potential chlorinated hydrocarbon impact (sweet odour soils).

As a precautionary measure to ensure the protection of the workforce and surrounding community, should any of the abovementioned substances (or any other unexpected potentially hazardous substance) be identified, the procedure summarised in **Figure 9.1** is to be followed.

An enlarged version of the Unexpected Finds Protocol, suitable for use on the site, should be posted in the Site Office and referred to during the site-specific induction by the Principal Contractor.

The sampling strategy for each “unexpected find” shall be designed by a suitably qualified environmental consultant. The strategy will, however, be aimed at determining the nature of the substance – that is, is it hazardous and, if so, is it at concentrations which pose an unacceptable risk to human health or the environment.

The sampling frequency of the identified substance/materials shall meet the minimum requirements outlined in EPA (1995) in addition to those outlined in **Section 8**.

9.1.1 Change in Development Plans

In the event that the development plans are changed from those available at the time of preparation of this RAP, particularly where changes in nominated land use, basements to intercept impacted groundwater or beneficial reuse of groundwater, consideration of the suitability of the proposed remedial strategy will be required.

Development plans should be reviewed in detail to identify any inconsistencies with the assumptions presented herein, and those inconsistencies addressed in site-specific RWPs, as discussed in **Section 10.1**.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9.1.2 Identification of Additional Underground Storage Tank

There is the potential that one or more additional USTs may be encountered during demolition of the pavements or subsequent earthworks. In the event of such an occurrence, the Unexpected Finds Protocol as discussed below (**Figure 9.1**) will be implemented.

9.1.3 Identification of Oily or Tarry Materials

In the event that oily/tarry materials are encountered, the provisions outlined in the Unexpected Finds Protocol will be implemented, comprising inspection, testing and appropriate action as advised by the Field Scientist (**Figure 9.1**).

Any suspected oily/tarry materials must be segregated from other excavated materials and placed in a designated area with appropriate odour and sediment controls until such time as appropriate assessment is completed and a methodology is confirmed for their appropriate management. In the event that the oily/tarry materials do not meet the site validation criteria, then they shall be stored in a secure area for later treatment or classified and removed from the site for treatment and/or disposal at an appropriately licensed facility.

9.1.4 Identification of Chlorinated Hydrocarbon Impact

In the event that chlorinated hydrocarbon impacted materials are encountered outside of the remedial area presented in **Figure 6** (potentially as a result of the identification of sweet odours in soils), the provisions outlined in the Unexpected Finds Protocol will be implemented, comprising inspection, testing and appropriate action as advised by the Field Scientist (**Section 9.1**).

Any suspected chlorinated hydrocarbon impacted materials must be segregated from other excavated materials and placed in a designated area with appropriate odour and sediment controls until such time as appropriate assessment is completed and a methodology is confirmed for their management. In the event that the materials do not meet the site validation criteria, then they shall be stored in a secure area for later treatment or classified and removed from the site for treatment and/or disposal at an appropriately licensed facility.

9.1.5 Material Storage Breach

In the event that any materials storage containment controls are breached and stockpiled materials classified as asbestos contaminated soil or otherwise have escaped (or have the potential to escape), then the management controls shall be rectified and investigations undertaken to review the adequacy of the controls and any improvements implemented. The REMP (**Section 10**) shall include a documented process for identifying and responding to such incidents.

9.1.6 Emissions Complaints

Due to the nature of the activities and type of contaminants identified within the site, there is a potential for complaints to be received from members of the public and/or occupants of surrounding properties relating to environmental emissions including:

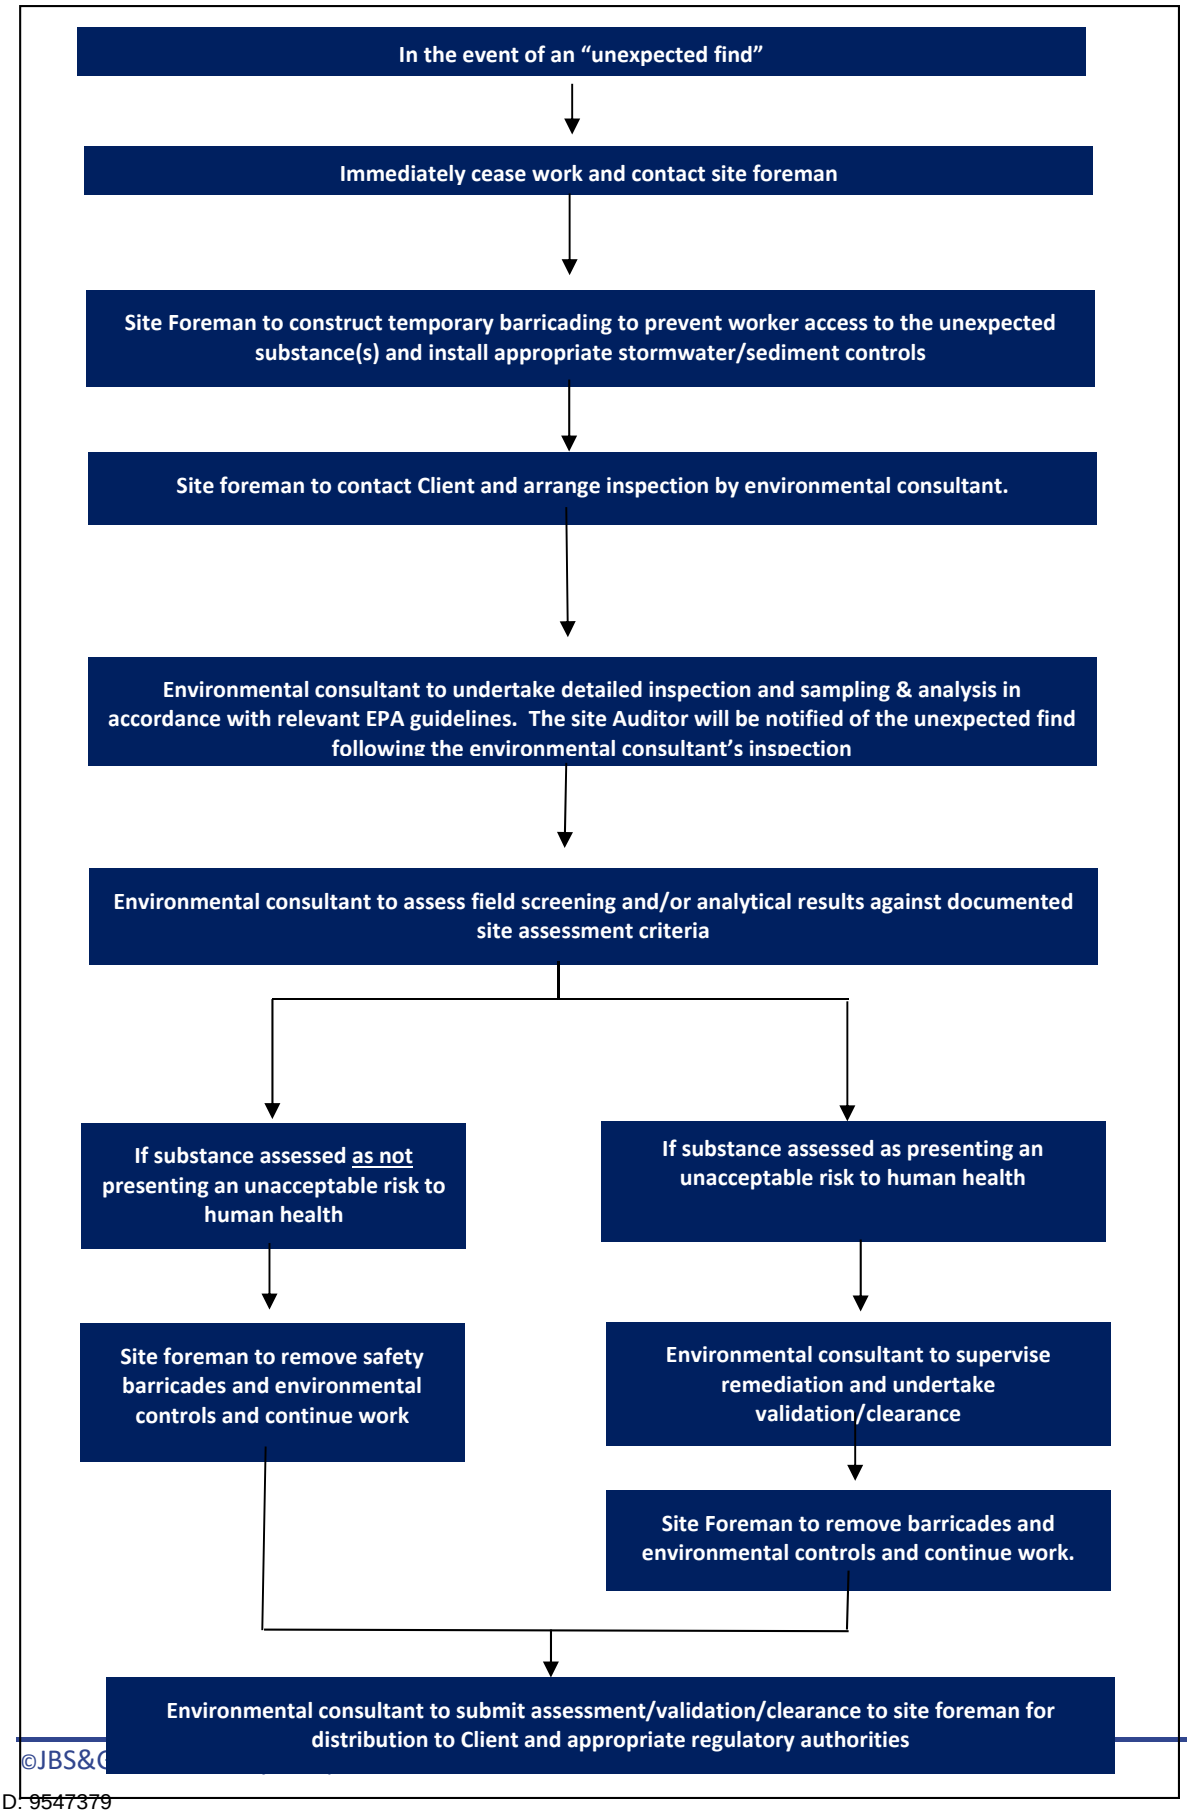
- Odour emissions arising from handling of malodorous soil;
- Noise and vibration arising from excavation, piling and other works;
- Dust emissions arising from excavation, material handling and placement; and
- Visibly impacted water quality in surface water discharge from the site.

Monitoring of all environmental emissions shall be undertaken during the works as detailed in the REMP (discussed in **Section 10**) and appropriate actions taken to further control emissions following receipt of a complaint. The REMP shall contain provision for contingency actions where excessive emissions occur, however it is anticipated that one or more of the following actions will be considered:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Increased application of odour screening/masking chemicals on odorous materials;
- Disturbance of soils during meteorologically favourable periods only; and/or
- Covering of impacted soils.

Figure 9.1 - Unexpected Finds Protocol



Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

10. Other Remediation Documents

10.1 Remedial Works Plans

As the proposed redevelopment / remediation staging becomes available, stage specific RWPs are required to be prepared. The RWPs will document the stage specific development details and identify any outstanding data gaps which are required to be addressed prior to implementation of the RWP. The RWPs will at least require:

- Identification of areas requiring additional environmental assessment including:
  - The extent of the area;
  - The required assessment method and proposed sampling locations (if appropriate);
  - Constituents of potential concern; and
  - Data quality objectives for validation of the area.
- Identification of areas requiring containment and proposed method of containment;
- Identification of areas of known / potential petroleum hydrocarbon impact and proposed remediation / treatment / disposal method;
- Validation methods and requirements for implementation of capping and treatment of petroleum hydrocarbon impacted soils;
- An UFP;
- An environmental management plan (EMP) to control potential emissions from remediation works. This should be particularly cognisant of particulates with elevated levels of PAHs and asbestos fibres;
- A Work Health and Safety Plan (WHSP) to be applied during the course of the remedial works to assess potential health and safety risks, appropriate measures to mitigate these risks and associated monitoring to assess actual risks;
- A Community Consultation Plan to notify all stakeholders including occupiers of neighbouring properties of the activities on the site; and
- The requirements for any long term/ongoing Environmental Management Plans to be applied long term after the completion of remediation / management works. Identification of the requirement, and associated validation, of any materials to be imported to/exported from site.

10.2 Environmental Management

10.2.1 Preparation of a Remediation Environmental Management Plan

Prior to commencement of remediation works, a REMP shall be prepared by the Principal Contractor or the Principal Contractors Remediation Contractor, which documents the environmental monitoring and management measures required to be implemented during the remediation and construction related activities associated with the construction of the site.

The REMP shall address each of the nominated items in **Section 10.2.2** and shall include the Contingency Plan, referred to in **Section 9**, above. Additional environmental management requirements may be required as part of development consent.

10.2.2 Required Elements/Procedures

An assessment of the proposed activities and the associated elements required to be incorporated into the REMP is provided in **Table 10.1**. The REMP is required to address each of the required

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

elements and procedures in full detail and to include detailed monitoring processes and procedures, corrective actions and reporting requirements.

Table 10.1 Required Elements of the REMP

Element	Specific Minimum Requirements to be included in REMP
1. Dust and Airborne Hazard Control	Dust and asbestos air monitoring. Provisions for dust control based on monitoring results.
2. Flora and Fauna	As appropriate.
3. Heritage/Archaeological	In accordance with relevant heritage/archaeological studies.
4. Visual Impacts	Visual monitoring at site boundary Specific colour requirements for various controls/measures, including PPE (e.g., navy coveralls)
5. Emergency Response	As appropriate. Procedures required for spill incident response including material storage breach.
6. Noise Control	Hours of operation, consistent with the consent conditions. Boundary monitoring at commencement of work site activities with Procedures for control and management of noise emissions, as appropriate (e.g., restricted hours).
7. Traffic	Controls on vehicle movements on public roads. Controls on transport of tar impacted materials.
8. Protection of Adjoining Structures	As appropriate.
9. Odour Control and Volatile Contaminant Exposure	Management of all potential gaseous phase volatile contaminant generating activities (i.e., excavation of VOC contaminated soils and treatment) with appropriate vapour controls incorporating safeguards and monitoring. Daily monitoring of odour levels at site boundary during handling of malodorous materials. Procedures for addressing elevated odour monitoring results, including, but not limited to: reduction in earthworks activities within odorous material areas during adverse meteorological conditions; application of odour masking solutions at the odour source or between identified source(s) and receptor(s); review of bio-pile operation and covering identified potential odour sources by hydro-mulching or with less odorous materials.
10. Handling of Contaminated Soil and Groundwater	Soil and water management (stockpiling, site access, excavation pump out, reinstatement).
11. Soil Storage/Placement Areas	Soil and water management (stockpiling, site access, excavation pump out, reinstatement). Bunding. Heavy vehicle/personnel decontamination. Interim storage requirements for materials requiring later treatment. Site drainage requirements, incorporating clean/dirty areas and modifications to existing surface water and drainage controls beneath retained pavements. Monitoring as required.
12. Sediment Control	Bunding. Collection/treatment/handling impacted sediments.
13. Operation of Site Office	As appropriate.
14. Decontamination of Heavy Equipment	As appropriate.
15. Environmental Monitoring	Monitoring of dusts, noise, odour and fibres. Monitoring as required for vibration and water releases. Inspection checklists and field forms. Monitoring within the Locomotive Workshop is required as per the requirements of the EMP and HHRA.
16. Environmental Criteria	Soil and water criteria as presented in this RWP
17. Material Classification	As detailed in this RWP. Materials tracking, including QA/QC inspection and sampling.
18. Community Relations Plan	Specific communication protocols, incorporating nomination of specific contact persons & details and requirements for communications/response register.
19. Incident Reporting	As appropriate, including standard form/checklist.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Element	Specific Minimum Requirements to be included in REMP
20. Security and Signage	Secure site perimeter. Site boundary signage.
21. EMP Review	As appropriate.
22. Training	As appropriate.
23. Contact Details	Company/personnel details, including names/phone numbers for: - Principal Contractor - Site Auditor - Remediation Consultant - Remediation Contractor - OH&S Compliance - Environmental Compliance
24. Stockpiling	All materials stockpiled onsite will be managed by the Remedial Contractor. Unique identification will be provided for each stockpile, the source of the stockpile, its estimated volume, material characterisation and its location onsite (via GPS) will also be recorded consistent with the Material Tracking Plan provided as **Section 8.6.12**. The following procedures will be implemented by the Remedial Contractor: No stockpiles of soil or other materials shall be placed on footpaths or nature strips unless prior Council approval has been obtained; All stockpiles of soil or other materials shall be placed away from drainage lines gutters or stormwater pits or inlets; All stockpiles of soil or other materials likely to generate dust or odours shall be covered; All stockpiles of chemically contaminated soil shall be stored in a secure area and be covered if remaining more than 24 hours; and All stockpiles of asbestos contaminated soils shall be kept damp and covered to minimise potential fibre release, and if left for more than 24 hours, be stored in a secure area.

10.2.3 Certification

Prior to commencement of remediation works, the Remediation Contractor is required to have the REMP endorsed as acceptable by the Environmental Consultant and Site Auditor appointed to validate the works.

A copy of the REMP and the endorsement to the satisfaction of Environmental Consultant or Site Auditor are required to be provided by the Principal Contractor/Remedial Contractor prior to commencement of remediation works.

10.2.4 Hours of Site Operation/Duration of Works

Remediation works shall be completed in accordance with the permissible hours of work and noise as nominated in of the Development Consent.

The appointed remediation contractor will be required to include a proposed schedule of remediation works within the REMP submitted for endorsement as discussed above.

Typical working hours presented following:

- Monday to Friday: 7am to 5pm; and
- Saturday: 8am to 1pm.

10.3 Health and Safety

10.3.1 Work Health and Safety Management Plan

A WHSP shall be prepared by the Remediation Contractor prior to commencement of remediation works. The Plan shall contain procedures and requirements that are to be implemented as a minimum during the works, in addition to the Contingency Plan, referred to in **Section 9**.

The objectives of the WHSP are:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- To apply standard procedures that minimises risks resulting from the works;
- To ensure all employees are provided with appropriate training, equipment and support to consistently perform their duties in a safe manner; and
- To have procedures to protect other site workers and the general public.

These objectives will be achieved by:

- Assignment of responsibilities;
- An evaluation of hazards;
- Establishment of personal protection standards, mandatory safety practices and procedures;
- Monitoring of potential hazards and implementation of corrective measures; and
- Provision for contingencies that may arise while operations are being conducted within the site.

10.3.2 Additional Site-Specific Elements/Procedures

In addition to the normal construction-related matters, the WHSP shall address the following site-specific specific hazards associated with the works relating to the management of contaminated soil and groundwater:

- Under/aboveground services, specifically potential petroleum infrastructure;
- Use of plant and machinery within confined spaces (i.e. tank pit excavations);
- Contact to asbestos contaminated soils, including friable asbestos;
- Contact with contaminated soil (heavy metals, TRH and PAHs), groundwater and vapours, including requirements for specific Personal Protective Equipment (PPE); and
- Heat/cold stress.

10.3.3 Asbestos

The WHSP will include an overview of the asbestos management plan (AMP) and shall comply with relevant NSW regulations.

During the remedial works, perimeter asbestos in air monitoring will be conducted at each applicable remedial works area boundary when soils with asbestos are being disturbed. Air monitoring will be conducted on a daily basis at relevant locations whilst disturbance of asbestos contaminated areas takes place.

Air monitoring will be conducted during any ground disturbance activities within impacted soil within the site to verify that implementation of appropriate control measures have been successful at managing the risk of air borne fibre generation. Air monitoring will be undertaken in accordance with the requirements of the National Occupational Health and Safety Commission (NOHSC) Asbestos Code of Practice and Guidance Notes, in particular the *Guidance note for the estimation of airborne asbestos dust* [NOHSC 3002:2005].

10.3.4 Additional Consideration of Chemical Contaminants

In addition to general assessment of the potential for exposure to chemical contaminants the WHSP should also include specific consideration of additional contaminants such as chlorinated hydrocarbon impacts to soils and lead and PAHs distributed throughout fill materials.

Volatile organic compound concentrations in air should be actively monitored throughout remediation works and any time that workers disturb potentially impacted soils. The services of an occupational hygienist are required full time during impacted soil disturbance activities to determine

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

the controls required to minimise potential health/safety risks to an acceptable level. When working with contaminated materials in general, care needs to be taken to ensure that the contamination is not introduced to the worker via ingestion, inhalation or absorption. The WHSP must detail the PPE and decontamination requirements to be followed to control the risks posed by potential exposure to chemical contaminants at/within the site.

As a precautionary measure, the WHSP should include the requirement for the plan to be revised in the event of an unexpected find of contaminated material during remediation and/or construction.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

11. Conclusions and Recommendations

11.1 Conclusions

Overall, it is considered that the proposed actions outlined in this RAP conform to the requirements of the *Contaminated Land Management: Guidelines for the NSW Site Auditor Scheme (3rd Edition)* (EPA 2017) because they are: technically feasible; environmentally justifiable; and consistent with relevant laws policies and guidelines endorsed by NSW EPA.

Subject to the successful implementation of the measures described in this RAP and the recommendations below, it is concluded that the site can be made suitable for the intended uses and that the risks posed by contamination can be managed in such a way as to be adequately protective of human health and the environment.

11.2 Recommendations

It is recommended that the processes outlined in this RAP be utilised to inform site specific RWPs and subsequently implemented, and that the following documentation be developed and implemented to ensure the risks and impacts during remediation works are controlled in an appropriate manner:

- Individual stage RWPs;
- A REMP, to document the monitoring and management measures required to control the environmental impacts of the works and ensure the validation protocols are being addressed; and
- A WHSP to document the procedures to be followed to manage the risks posed to the health of the remediation workforce.

During the period preceding remediation of the site, ongoing monitoring of potential risks to site receptors shall be completed in accordance with JBS&G (2019c[26])

The REMP and WHSP will require to be cognisant of the potential occurrence and storage/handling of asbestos contaminated soils.

Upon completion of the works, or within various specific areas, validation report(s) are required to be submitted by the Remediation Consultant to the Site Auditor for certification that the site, or relevant portion(s) are suitable for the proposed uses.

12. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquires.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

List of NSW Contaminated Sites Notified to EPA as of 22 December 2017

Background

A strategy to systematically assess, prioritise and respond to notifications under Section 60 of the *Contaminated Land Management Act 1997* (CLM Act) has been developed by the EPA. This strategy acknowledges the EPA's obligations to make information available to the public under *Government Information (Public Access) Act 2009*.

When a site is notified to the EPA, it may be accompanied by detailed site reports where the owner has been proactive in addressing the contamination and its source. However, often there is minimal information on the nature or extent of the contamination.

For some notifications, the information indicates the contamination is securely immobilised within the site, such as under a building or carpark, and is not currently causing any offsite consequences to the community or environment. Such sites would still need to be cleaned up, but this could be done in conjunction with any subsequent building or redevelopment of the land. These sites may not require intervention under the CLM Act, but could be dealt with through the planning and development consent process.

Where indications are that the nominated site is causing actual harm to the environment or an unacceptable offsite impact (i.e. it is a "significantly contaminated site"), the EPA would apply the regulatory provisions of the CLM Act to have the responsible polluter and/or landowner investigate and remediate the site.

As such, the sites notified to the EPA and presented in the following table are at various stages of the assessment and/or remediation process. Understanding the nature of the underlying contamination, its implications and implementing a remediation program where required, can take a considerable period of time. The tables provide an indication, in relation to each nominated site, as to the management status of that particular site. Further detailed information may be available from the EPA or the responsible landowner.

The following questions and answers may assist those interested in this issue:

Frequently asked questions

What is the difference between the "List of NSW Contaminated Sites Notified to the EPA" and the "Contaminated Land: Record of Notices"?

A site will be on the Contaminated Land: Record of Notices only if the EPA has issued a regulatory notice in relation to the site under the *Contaminated Land Management Act 1997*.

The sites appearing on this "List of NSW contaminated sites notified to the EPA" indicate that the notifiers consider that the sites are contaminated and warrant reporting to the EPA. However, the contamination may or may not be significant enough to warrant regulation by the EPA. The EPA needs to review and, if necessary, obtain more information before it can make a determination as to whether the site warrants regulation.

Why my site appears on the list?

Your site appears on the list because of one or more of the following reasons:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- The site owner and/or the person partly or fully responsible for causing the contamination notified to the EPA about the contamination under Section 60 of the *Contaminated Land Management Act 1997*. In other words, the site owner or the "polluter" believes the site is contaminated.
- The EPA has been notified via other means and is satisfied that the site is or was contaminated.

Does the list contain all contaminated sites in NSW?

No. The list only contains contaminated sites that the EPA is aware of, with regard to its regulatory role under the CLM Act. An absence of a site from the list does not necessarily imply the site is not contaminated.

The EPA relies upon responsible parties to notify contaminated sites.

How are these notified contaminated sites managed by the EPA?

There are different ways that the EPA manages these notified contaminated sites. First, an initial assessment is carried out by the EPA. At the completion of the initial assessment, the EPA may take one or more than one of the following management approaches:

- The contamination warrants the EPA's direct regulatory intervention either under the *Contaminated Land Management Act 1997* or the *Protection of the Environment Operations Act 1997* (POEO Act), or both. Information about current or past regulatory action on this site can be found on EPA website.
- The contamination with respect to the current use or approved use of the site, as defined under the *Contaminated Land Management Act 1997,* is not significant enough that it warrants EPA regulation.
- The contamination does not require EPA regulation and can be managed by a planning approval process.
- The contamination is related to an operational Underground Petroleum Storage System, such as a service station or fuel depot. The contamination may be managed under the POEO Act and the Protection of the Environment Operation (Underground Petroleum Storage Systems) Regulation 2008.
- The contamination is being managed under a specifically tailored program operated by another agency (for example the Department of Industry and Investment's *Derelict Mines Program*).

I am the owner of a site that appears on the list. What should I do?

First of all, you should ensure the current use of the site is compatible with the site contamination. Secondly, if the site is the subject of EPA regulation, make sure you comply with the regulatory requirements, and you have considered your obligations to notify other parties who may be affected.

If you have any concerns, contact us and we may be able to offer you general advice, or direct you to accredited professionals who can assist with specific issues.

I am a prospective buyer of a site that appears on the list. What should I do?

You should seek advice from the vendor to put the contamination issue into perspective. You may need to seek independent expert advice.

The information provided in the list is meant to be indicative only, and a starting point for your own assessment. Site contamination as a legacy of past site uses is not uncommon,

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

particularly in an urbanised environment. If the contamination on a site is properly remediated or managed, it may not materially impact upon the intended future use of the site. However, each site needs to be considered in context.

List of NSW Contaminated Sites Notified to the EPA

Disclaimer

The EPA has taken all reasonable care to ensure that the information in the list of contaminated sites notified to the EPA (the list) is complete and correct. The EPA does not, however, warrant or represent that the list is free from errors or omissions or that it is exhaustive.

The EPA may, without notice, change any or all of the information in the list at any time.

You should obtain independent advice before you make any decision based on the information in the list.

The list is made available on the understanding that the EPA, its servants and agents, to the extent permitted by law, accept no responsibility for any damage, cost, loss or expense incurred by you as a result of:

1. any information in the list; or
2. any error, omission or misrepresentation in the list; or
3. any malfunction or failure to function of the list;
4. without limiting (2) or (3) above, any delay, failure or error in recording, displaying or updating information.

Site Status	Explanation
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or *Protection of the Environment Operations Act 1997*. Alternatively, the EPA may require information via a notice issued under s77 of the *Contaminated Land Management Act 1997* or issue a Preliminary Investigation Order.
Regulation under CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the *Contaminated Land Management Act 1997* is not required.
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997*. A regulatory approach is being finalised.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the *Protection of the Environment Operations Act 1997* (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the *Environmental Planning and Assessment Act 1979* (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the *Contaminated Land Management Act 1997* (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the *Protection of the Environment Operations Act 1997* (POEO Act).
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the *Environmental Planning and Assessment Act 1979* (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the *Contaminated Land Management Act 1997* (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record.

Material Classification Form (example)

MCF Reference # 1000_____

Completed by	Nathan Cussen
Date	24 July 2015
Material Identification (Stockpile name and grid reference, importation source name and unique identification name etc.)	Type A Soils - Organic Garden Mix from Benedict Industries
Source location (Stockpile name and grid reference, source location and grid reference, off-site source address and description of source site residential, quarry etc.)	On site □ Details: Off site (Source Site) ☒ Details: Stockpile located at Menangle Quarry Benedict Industries, Menangle Road, Menangle, NSW.
JBS&G material classification report reference	JBS&G 1000 Date: 24 July 2015
Summary of material characterisation report as prepared by JBS&G	VENM □ for importation ENM □ Reuse on Site □ Waste Classification □ Other ☒ please describe VENM silty sand blended with recovered fines topsoil, ash, fowl manure and composted organics to be imported to site
Volume of material	Survey Information □ Field Estimate □ Required Quantity (off-site source) ☒ Approximately 65 m^3
Material description (material type, colour, inclusions, etc.)	Type A Organic Garden Mix – brown VENM alluvial silty sand and topsoil blended with recovered fines topsoil, ash, fowl manure and compost organics
Is the material free of ACM, staining and malodourous soils	Yes ☒ No □ Details:
If assessment is of material from an off-site Source, is the material suitable for importation to the site?	Yes, the material is suitable to be imported to site.
If assessment is for off-site disposal of material, what is the final waste classification / reuse exemption conclusion?	N/A
If the assessment is for reuse of the material at the site, is the material suitable for reuse	Suitable for reuse: - below the capping profile in road corridor □ - above the capping profile in road corridor footprint and used in landscaped areas ☒ - below the capping profile in recreational areas □ - above the capping profile in recreational areas and used in landscaped areas ☒ - below the marker layer in Lots 8 and 9 □ - above the marker layer in Lots 8 and 9 and used within landscaped areas ☒ - below the marker layer in Lot 12 □ - above the marker layer in Lot 12 and used within landscaped areas ☒
Other comments:	Please ensure Benedict dockets are retained, the volume imported documented and all materials tracked in accordance with the materials tracking plan.

Dear Wasique,

Re: Interim Advice 1 (IA1) – Review of Draft Sampling, Analysis and Quality Plan (SAQP), Penrith City Park, NSW

1 Introduction

Penrith City Council (Council) has appointed Rebeka Hall of Zoic Environmental Pty Ltd (Zoic), a NSW EPA Auditor accredited (No. 0802) under the Contaminated Land Management (CLM) Act 1997, to conduct an Audit for the proposed Penrith City Park located at the corner of Henry and Station Streets, Penrith NSW ("the site"). The future park 'site' is legally identified as:

- Lot 1 in DP254763 – Henry Street (to be west of Lot 1 in DP113118)
- Lot 1 in DP164798 and Lot 1 in DP252457 – 134-138 Henry Street
- Lot 10 and 11 in DP553665 – 142 Henry Street
- Lot 2 in DP 556075 – 144 Henry Street
- Lot 3 in DP1200790 – 42 to 44 Station Street
- Lot 1 in DP 526304 – 48 to 50 Station Street
- Lot E DP 163176 – 46 Station Street
- Western portion of Allen Place Car Park, Gaymark Lane and Allen Place (no lot and DP available)

The site occupies an area of approximately 7,500m^2 and is currently used as commercial, retail and car parking area.

The proposed development will comprise a large open recreational space, consisting a mixture of paved and grassed areas including shallow/deep planted gardens and potentially raised garden boxes.

The aim of the engagement is to enable a site audit statement (SAS) and associated site audit report (SAR) to be prepared that confirms the suitability of the site for proposed redevelopment

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

as open recreational space at the completion of remedial works. This audit is being conducted in accordance with the requirements outlined in the NSW EPA (2017) Contaminated Land Management Guidelines for the NSW Site Auditor Scheme (3rd edition).

2 Scope of Audit and Nature of Interim Advice

NSW EPA (2017) describes the site assessment and audit process as:

1. *Consultant is commissioned to assess contamination*. The contaminated site consultant designs and undertakes the site assessment and, where required, all remediation and validation activities to achieve the objectives specified by the owner or developer; and
2. *Site auditor reviews the consultant's work*. The site owner or developer commissions the Auditor to review the consultant's work. The Auditor then prepares a SAR and SAS at the conclusion of the review, which are given to the owner or developer.

Therefore, the contaminated land consultant and other relevant parties should be satisfied that the work to be conducted conforms to all appropriate regulations, standards and guidelines and is suitable based on the site history and the proposed land use.

It is understood that the Audit is currently non statutory in nature. Once development approval is issued by Council, the Audit will become statutory in nature and require notification to NSW EPA.

3 Current Interim Advice

In preparing this interim audit advice, the Auditor has reviewed the following related to further land contamination assessment required at the site:

- JBS&G Australia Pty Ltd (JBS&G, 23 March 2020) Pre-Remediation Investigation, Sampling Analysis and Quality Plan, Penrith Central Park Village, Ref: 58140/127353 Rev A, referred to as the JBS&G (23 March 2020) Draft SAQP.

The purpose of the current IA is to document Auditor findings following the review of the scope of work proposed as part of the pre-remediation assessment.

The SAQP has been prepared for the pre-remediation assessment of soils underlying 134-138 and 140 Henry Street, which was denoted as Area of Environmental Concern (AEC) AEC1 in the Auditor endorsed Remediation Action Plan (RAP)[1]. AEC1 was located within the former dry cleaning operation. The other 3 AECs identified in the RAP will not be assessed as part of the current pre-remediation assessment.

The 'investigation area' for the pre-remediation assessment is limited to the properties at 124-138 and 140 Henry Street (AEC 1).

[1] In September 2017, Zoic was commissioned by Council to complete a Section B Site Audit (Zoic Ref: 19124) for the Central City Park development (for both the Future Park (western portion) and Developable Area (eastern portion)). At the end of the site audit, a Site Audit Statement (SAS) was issued, certifying that, in the opinion of the Auditor that the site can be made suitable for the proposed development if the site is remediated in accordance with the JBS&G (5 March 2019) Penrith Central Park Village Overarching Remedial Action Plan 114 to 146 Henry Street, 42 to 50 Station Street, and Allen Place Car Park (Ref: 55073/120362 Rev 0) subject to compliance with conditions as stated in the Site Audit Statement.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4 Summary of Proposed Pre-remediation Assessment

The objective of the pre-remediation assessment is to inform the remedial extent within the investigation area (denoted as AEC 1 in the RAP and SAQP). The remedial works aims to render the site suitable including no impact to future offsite receptors in basements/buildings to the east (not part of this current development stage, but within the greater Penrith Central Park Village) and the removal of ongoing source of contamination to groundwater.

The scope of investigation will include the following:

- Installation of 18 sub-slab soil vapour probes across AEC1 and the existing sewer pipe network beneath the site.
- Installation of 5 soil vapour probes to depths of either 1m or 4m at each location. Location of the deep soil vapour problems will be informed by sub-slab vapour results and will depend on site access. JBS&G indicates that vapour probes are likely to be installed within areas of greatest chlorinated ethene (CE) impact and towards the eastern boundary of the site, adjacent to the proposed future basement development.
- As part of the drilling works, soil cutting will also be screened with a field gas GC-PID instrument. Results from the GC-PID measurements will be compared to carbon tube duplicate samples submitted to a NATA accredited laboratory for VOC 8260 analysis.
- Soil vapour sampling will be conducted at least 24hrs after installation using the carbon tube method.
- All samples collected from sub-slab and soil vapour probes will be analysed for VOC8260.
- Soil samples will also be collected during the drilling of deep soil vapour probes for preliminary waste classification. Soil samples will be analysed for BTEX, TPH, PAH, OCP, PCB, VOC, heavy metals, asbestos and TCLP (metals and PAH).

5 Auditor Evaluation of SAQP

The sampling and analysis plan and associated methodologies proposed have been evaluated by the Auditor with comments provided in Table 1 for Soil Assessment and Table 2 for Soil Vapour Assessment.

Table 1: Sampling and Analysis Plan for Soil

Sampling Item	EPA Guidelines	JBS&G (30 March 2020) SAQP	Auditor Comments
Data Quality Objectives (DQOs) (soil vapour and soil assessments)	"Data Quality Objectives: Outline of the DQO Process" in Schedule B2 of NEPM (2013).	The 7 step DQOs for **investigation**, as summarised in Section 7, are as follows: • Step 1: Remedial works are required for principally chlorinated ethene impact for the site. The works is required to assess data gap such that the remedial works plan (RWP) can be prepared for the development area. • Step 2: Decisions are: has the impact/s been delineated?; preliminary waste class; impacts of chemical mixtures; and further	The Auditor considers the DQOs for **investigation** works to be appropriate

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Sampling Item	EPA Guidelines	JBS&G (30 March 2020) SAQP	Auditor Comments
		assessment requirement (if needed). • Step 3: Inputs are previous data, lab data, site criteria and QA/QC. • Step 4: Boundaries are AEC1; 0.5m into natural; 4mbgs. • Step 5: Decision rules are meeting NEPM (2013) criteria; delineation achieved?; waste classification; impacts of chemical mixtures and, further assessment required? • Step 6: Decision error limits based on AS4482.1-1995 for number of samples to make a decision. • Step 7: Design for optimising data collection by sampling as per SAQP.	
Sampling Pattern Rationale:	The EPA (1995) Sampling Design Guidelines (Section 2.3) provides details on judgmental, random, systematic and stratified sampling pattern.	Section 7.3 states that soil samples will be collected from deep soil vapour probes, of which final locations will be dependent on outcome of soil vapour assessment.	Given the purpose of soil assessment work is to inform preliminary waste classification, it is considered acceptable, noting that additional sampling will be conducted prior to actual waste disposal during remedial/construction works.
Sampling Density Rationale:	EPA (1995) Sampling Design Guidelines	No information provided. Section 7.3 states that soil samples will be collected from deep soil vapour probes, of which final locations will be dependent on outcome of soil vapour assessment.	Given the purpose of soil assessment work is to inform preliminary waste classification, it is considered acceptable.
Locations Shown on Site Plan:	The OEH (2011) Guidelines for Consultants reporting on Contaminated Sites requires that sampling locations are shown on a site plan.	The locations are shown on Figures in Appendix A. JBS&G notes that deep soil vapour probes / soil sampling locations will be installed after assessment of sub-slab soil vapour result therefore locations are not shown on figures in Appendix A.	The Auditor considers this requirement to have been met.
Sampling Depths	The OEH (2011) Guidelines for Consultants Reporting on Contaminated Sites requires information on the depths of samples that were collected. NEPM (2013) Schedule B2.	Section 7.3 states that 'soil samples will be collected directly underneath the hardstand (concrete) then generally at 0.5-1.0 m intervals to a maximum depth of 4 m'.	The Auditor considers the sampling depths to be appropriate.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Sampling Item	EPA Guidelines	JBS&G (30 March 2020) SAQP	Auditor Comments
Selection of Samples for Analysis:	The OEH (2011) Guidelines for Consultants Reporting on Contaminated Sites. NEPM (2013) Schedule B2	Table 7.3 states that 5 samples will be selected for soil analysis.	The Auditor considers the selection of samples for analysis to be appropriate.
Sample Splitting Techniques and Statement of QA/QC Sample Frequencies	NEPM (2013) Schedule B3 EPA (2017) Guidelines for the NSW Site Auditor Scheme OEH (2011) Guidelines for Consultants Reporting on Contaminated Sites	Section 7.3 states that 'duplicate soil samples will be collected at a rate of one per 20 primary samples. Duplicate samples will be collected for QA/QC purposes from the push tube by taking discrete soil samples and placing directly into the sample jars. Samples will not be mixed prior to placement into the jars to minimise the potential for loss of volatiles. Similarly, where 500 mL samples will be required for duplicate asbestos analysis - no mixing of material will be undertaken prior to placement into plastic bags to prevent the loss of free fibres'.	The Auditor considers that the sample splitting techniques were appropriate. The QA/QC sampling frequencies for the investigations generally comply with NEPM (2013) requirements. The Auditor considers this to be acceptable.
Analytical Methods:	EPA (2017) Guidelines for the NSW Site Auditor Scheme	Section 7.4 states that 'JBS&G will contract Eurofins/mgt (Eurofins) as the primary laboratory, with Envirolab Services (Envirolab) as the secondary laboratory. Both laboratories are NATA registered for the required analyses'.	The Auditor considers the analytical methods to be appropriate.
Sample Container Selection:	NEPM (2013) Schedule B2 and B3	Section 7.3 states that 'collected samples will be immediately transferred to laboratory supplied sample jars (additional 500 mL plastic bags will be used where asbestos analysis is required)'.	The Auditor considers the sample container selection to be appropriate.
Sampling Devices / Techniques	NEPM (2013) Schedule B2 and B3 DEC (2007) Groundwater Guidelines	Section 7.3 states that 'soil samples will be collected via push tube or solid flight auger (to be only used if required for the collection of soil samples at depth) sampling using a Geoprobe track mounted drilling rig at the nominated borehole locations for the installation of deep soil vapour probes'.	The Auditor considers the sampling devices / techniques adopted to be appropriate.
Decontamination Procedures:	Australian Standard AS4482.1 – 2005 NEPM (2013) Schedule B2 and B3	Section 7.3 states that 'all non-disposable sampling equipment, including augers, will be cleaned with a high pressure water/ detergent	The Auditor considers the decontamination procedures to be appropriate.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Sampling Item	EPA Guidelines	JBS&G (30 March 2020) SAQP	Auditor Comments
		spray, rinsed with water and then air dried. The equipment was then inspected to ensure that no soil, oil, debris or other contaminants were apparent on the equipment prior to the commencement of works. Sampling equipment was subsequently decontaminated using the above process between each location'.	
Sample Handling and Preservation Procedures:	NEPM (2013) Schedule B3 AS4482.1 and AS 4482.2	Section 7.3 states that 'the sample jars/bags will then transferred to a chilled ice box for sample preservation prior to and during shipment to the testing laboratory. A chain-of-custody form will be completed and forwarded with the samples to the testing laboratory'.	The Auditor considers these procedures to be appropriate.
Field Calibration and Screening Protocols	NEPM (2013) B2	Section 7.3 states that 'soil samples will be screened on site during works using a PID and GC-PID to assess the presence of VOCs including TCE and PCE'.	The Auditor considers the field calibration and screening protocols to be appropriate.
Groundwater Monitoring Well Installation	NEPM (2013) Schedule B2 DEC (2007)	Not proposed	Not applicable
Groundwater Monitoring Well Development & Sampling	NEPM (2013) Schedule B2 DEC (2007)	Not proposed	Not applicable

Table 2. SAQP for Soil Vapour Sampling

Requirement	Guideline	JBS&G (30 March 2020) SAQP	Auditor Comment
Location and number of sampling points	Section 9.4.1 NEPM B2 (2013)	JBS&G proposes 18 sub-slab soil vapour pins to be installed across AEC1 and the vicinity of existing sewer line where soil vapour impacts were previously identified. The pins will be installed on a 12m by 8m grid. Following review of the sub-slab soil vapour samples, an additional 5 deep soil vapour probes will be installed. JBS&G states that 'the location of the deep soil vapour probes will be informed by the results of the sub-slab vapour assessment and on site access. Noting that the sample locations will be required to inform the depth of	**The proposed grid is less than the density proposed in JBS&G (5 March 2020) Overarching RAP where a 5m grid was nominated.** **The proposed sampling points along the sewer line appear to be approx. 10m apart from each other.** **Please justify.**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Guideline	JBS&G (30 March 2020) SAQP	Auditor Comment
		excavation required to be protective of future off-site receptors in potential basements/buildings to the east (within the PCPV development), it is likely that the probes will be installed within areas of greatest identified CE impact (in sub-slab vapour) and towards the eastern boundary of the subject site'.	
Depth of sampling point	Section 9.4.1 NEPM B2 (2013)	Section 7.2.1 states that the sub-slab vapour probe will be installed to approx. 0.15mbgs, which is the anticipated thickness of concrete slab. Section 7.2.1 states that the soil vapour probe will be installed to 1m or 4m deep at each location.	Acceptable for sub-slab vapour pin. **Please clarify the proposed depth of soil vapour probe. Does JBS&G mean 1 to 4m?**
Frequency of sampling	Section 9.4.1 NEPM B2 (2013) CRC Care Technical Report 13 (2009)	No information provided.	**Please confirm the number of sampling rounds? Climatic conditions to be considered.**
Sampling installation method	Section 9.4.2.2 NEPM B2 (2013)	Sub-slab vapour pins will be installed as follows: • Record location of probe using GPS; • Drill a 16 mm diameter hole through the concrete slab which is anticipated to be approximately 150 mm thick; • Installation of a VaporPin metallic probe following the manufacturer's instructions, which briefly comprises hammering the probe with silicone sleeve into the drilled hole to a depth of the encountered slab thickness; and • Undertake a leak test Soil vapour probes will installed as follows: • Installation of soil vapour probe by use of teflon tubing, consisting of placement of 2mm graded sand adjoining the base of the sample tube, placement of a nominal thickness of bentonite chips overlying the graded sand, completion of borehole by filling with grout / bentonite chips to the site surface	The Auditor considers the sampling installation method to be appropriate.
Equilibration period	Section 9.4.2.2 & 9.4.2.4 NEPM B2 (2013)	Section 7.2.3 states that 'soil vapour probes will be left to equilibrate for a period of at least 24 hours before sampling.	Acceptable
Sampling method	Section 9.5.1 & 9.5.2 NEPM B2 (2013)	Active sampling using carbon tubes at a constant flow rate.	Acceptable
Probe integrity / seal	Section 9.4.2.4 NEPM B2 (2013)	Section 7.2.3 states that 'leak detection evaluation will be completed via placement of an isopropyl alcohol	Acceptable

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Guideline	JBS&G (30 March 2020) SAQP	Auditor Comment
		soaked rag within an air tight box containing the sample train over the top of the backfilled borehole, to assess the potential occurrence of leaks whilst the gas detector is used to purge the sample point. Elevated PID readings on the gas detector will be assumed to indicate a leaking probe. Any leaking probes will be required to be re-installed and rechecked prior to sampling using the same method'.	
Tubing type	Section 9.4.2.4 NEPM B2 (2013)	Teflon tubing	Acceptable
Sample flow rate 0.1-100L/min	Section 9.4.2.4 NEPM B2 (2013)	210mL/min using a calibrated pump	Acceptable
Sample volume and duration	Section 9.4.2.4 NEPM B2 (2013)	6.3L at a rate of 210mL/min which equates to 30min sample time.	Acceptable
Purge method and biodegradation monitoring	CRC Care Technical Report 13 (2009)	Section 7.2.3 states that 'an MX6 gas detector will then be used to purge each probe for a period of approximately 30 seconds. Gas readings will be monitored until oxygen and photo-ionisation detector (PID) readings stabilise'.	Acceptable
Sample splitting	Section 19.10 NEPM B2 (2013)	No information provided.	**Please provide**
Duplicate frequency	Section 19.10 NEPM B2 (2013)	No information provided.	**Duplicate samples should be collected at a rate of 1 per 20 primary samples as per NEPM 2013.**
Analytical methods	Section 19.10 NEPM B2 (2013)	VOC 8260	The Auditor considers this analytical method to be appropriate

6 Auditor Comments

The Auditor has reviewed the JBS&G (23 March 2020) Draft SAQP against relevant guidelines made or approved by NSW EPA. The report largely meets the guideline requirements, however, the Auditor provides the following **comments to be addressed by JBS&G in finalising the SAQP and completing the proposed pre-remediation investigation works**:

1. General comment: No site assessment criteria is provided for review.
2. General comment: Please confirm and justify the proposed number of soil vapour sampling.
3. General comment (soil vapour QA/QC program): No information is provided for soil vapour duplicate sampling procedures. Field QA/QC sampling should be conducted in accordance with NEPM 2013.
4. General comment: Additional deep soil vapour probes should be considered if sub-slab results show high concentrations across AEC1.
5. Section 7.2 (sub-slab / soil vapour assessment): The proposed sampling density is on a 12m by 8m grid, which is less than the density nominated in the endorsed JBS&G (5 March 2019) Overarching RAP (5m grid). The sampling points along the sewer pipe is approx. 10m apart from each other. Please justify the deviation in approach.
6. Section 7.2.2 (soil vapour probe installation): It is noted that soil vapour probe will be installed to either 1m or 4m deep. Does JBS&G mean 1m to 4m deep? Please clarify.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7. Table 7.3: Please clarify why 4 samples are to be selected for asbestos analysis.
8. Section 7.5 (data assessment): Assessment report is to be forwarded to the Auditor for review and endorsement prior to preparation of RWP.

This interim advice does not constitute a SAS or a SAR, but rather is provided to assist the Client in the assessment and management of contamination issues at the site. The information provided herein should not be considered pre-emptive of the final Audit conclusions. It represents the Auditor's opinion based on the review of currently available information.

Should you have any queries or wish to discuss any points, please do not hesitate to contact Fiona Wong or the undersigned.

Yours sincerely,

Rebeka Hall
NSW EPA Accredited Site Auditor

Summary of Responses to Interim Advices No. 01
Penrith Central Park Village

Dear Rebeka,

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (Penrith, the client) to provide environmental consultancy services associated with the proposed redevelopment of the Penrith City Village Park (PCPV). JBS&G has recently been in receipt of:

- Interim Advice 1 (IA1) – Review of Draft Sampling and Analysis Plan, Penrith City park, NSW, 9 April 2020, Zoic Environmental Pty Ltd (Zoic 2020).

Responses to each of the issues raised in the interim advice are detailed following. A revised copy of the Sampling, Quality and Analysis (SAQP JBSG 2020[1]) has been prepared consistent with the scope of the actions to address each of the comments in IA1.

IA1 – SAQP

1. *General comment: No site assessment criteria is provided for review.*

Section 7.5 has been updated to provide the assessment criteria intended to be applied to the assessment.

2. *General comment: Please confirm and justify the proposed number of soil vapour sampling.*

The proposed number of sampling locations is provided in Table 7.3. As noted, the proposed sampling density is less than that specified in the RAP (JBS&G 2019a) due to access restrictions in which certain areas/commercial spaces are currently tenanted. Where access can accommodate a sampling density of a 5 m grid (in accordance with the RAP), JBS&G will conduct the sampling in accordance with this density to refine the required remedial extent. However, should access be limited and the proposed sampling density (as per SAQP) is implemented – the remedial extent will still be defined (albeit to less resolution) and the broad objectives of the pre-remediation investigation will still be satisfied. Section 7.2 has been updated.

[1] *Sampling Analysis and Quality Plan for* Pre-Remediation Investigation, Penrith Central Park Village, 134 to 144 Henry Street, 42 to 50 Station Street and Allen Place Car Park, JBS&G Australia Pty Ltd, 28 April 2020 (JBS&G 2020).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. *General comment: No information is provided for soil vapour duplicate sampling procedures. Field QA/QC Sampling should be conducted in accordance with the NEPM 2013.*

Blind and split duplicate samples will be collected sequentially, following the collection of the primary sample in accordance with the procedures described in Section 7.2.3. Blind and split duplicate samples will be collected at a rate of 1/20 primary samples. Section 7.2.3 has been updated.

4. *General comment: Additional deep soil vapour probes should be considered if sub-slab results show high concentrations across AEC1.*

Comment noted and agreed. The primary objective of the deep soil vapour probes is to assess the likely remedial excavation depth across AEC1. Should additional probes assist with refining the required remedial depths across AEC1 – JBS&G will complete the additional sampling where possible and subject to Council approval.

5. *Section 7.2 (sub-slab / soil vapour assessment): The proposed sampling density is on a 12 m by 8 m grid, which is less than the density nominated in the endorsed JBS&G (5 March 2019) Overarching RAP (5 m grid). The sampling points along the sewer pipe is approx. 10 m apart form each other. Please justify the deviation in approach*.

See response to Comment 2, in which the reduced sampling density is a result of constrained access. Where possible, JBS&G will complete the sampling density in accordance with the RAP (JBS&G 2019).

6. *Section 7.2.2 (soil vapour probe installation): It is noted that soil vapour probe will be installed to either 1 m or 4 m deep. Does JBS&G mean 1 m to 4 m deep? Please clarify.*

It is proposed to collect soil vapour samples from both 1 and 4 m depths within each 'deep soil vapour probe' location to inform likely remedial excavation depths. Section 7.2.3 has been updated to remove the ambiguous language.

7. *Table 7.3: Please clarify why 4 samples are to be selected for asbestos analysis.*

The proposed asbestos analysis is simply to inform preliminary waste classification of fill-based soils within the source area of AEC1.

8. Section 7.5 (data assessment): Assessment report is to be forwarded to the Auditor for review and endorsement prior to preparation of RWP.

Noted and agreed. Section 7.5 has been updated.

Should you require clarification, please contact the undersigned on 02 8245 0300 or by email cbielby@jbsg.com.au.

Yours sincerely:

Chris Bielby

Attachment 1 – Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquiries.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

Dear Wasique,

Re: Interim Advice 1 (IA3) – Review of Draft Pre-Remediation Investigation and Remedial Work Plan (RWP), Penrith City Park, NSW

1 Introduction

Penrith City Council (Council) has commissioned Rebeka Hall of Zoic Environmental Pty Ltd (Zoic), a NSW EPA Auditor accredited (No.0802) under the Contaminated Land Management (CLM) Act 1997, to conduct an Audit for the proposed Penrith City Park located at the corner of Henry and Station Streets, Penrith NSW ("the site"). The future park 'site' is legally identified as:

- Lot 1 in DP254763 – Henry Street (to be west of Lot 1 in DP113118)
- Lot 1 in DP164798 and Lot 1 in DP252457 – 134-138 Henry Street
- Lot 10 and 11 in DP553665 – 142 Henry Street
- Lot 2 in DP 556075 – 144 Henry Street
- Lot 3 in DP1200790 – 42 to 44 Station Street
- Lot 1 in DP 526304 – 48 to 50 Station Street
- Lot E DP 163176 – 46 Station Street
- Western portion of Allen Place Car Park, Gaymark Lane and Allen Place (no lot and DP available)

The site occupies an area of approximately 7,500m^2 and is currently used as commercial, retail and car parking area.

The proposed development will comprise a large open recreational space, consisting a mixture of paved and grassed areas including shallow/deep planted gardens and potentially raised garden boxes.

The aim of the engagement is to enable a site audit statement (SAS) and associated site audit report (SAR) to be prepared that confirms the suitability of the site for proposed redevelopment

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

as open recreational space at the completion of remedial works. This audit is being conducted in accordance with the requirements outlined in the NSW EPA (2017) Contaminated Land Management Guidelines for the NSW Site Auditor Scheme (3rd edition).

2 Current Interim Advice

The Auditor had previously issued IA1 (9 April 2020) and IA2 (11 May 2020) on the JBS&G Sampling Analysis and Quality Plan (SAQP). The JBS&G (1 May 2020) SAQP was prepared for the pre-remediation assessment of soil underlying 134-138 and 140 Henry Street, referred to as Area of Environmental Concern 1 (AEC1) as required by the Auditor endorsed Remediation Action Plan (RAP)[1]. The objective of the pre-remediation assessment was to inform the extent of remediation required for AEC1. AEC1 is the portion of the site impacted by contaminants associated with former dry-cleaning operations. The other 3 AECs (AEC2-former service station to the east; AEC3 soils under transformers; AEC4 unknown quality of fill material underlying buildings and pavement) identified in the RAP do not form part of the current pre-remediation assessment.

In preparing this interim audit advice, the Auditor has reviewed the following related to further assessment conducted for AEC1:

- JBS&G Australia Pty Ltd (JBS&G, 17 September 2020) Pre-Remediation Investigation, Penrith Central Park Village, Ref: 58140/131749 Rev A, referred to as the JBS&G (17 September 2020) Draft Pre-Remediation Investigation Report.
- JBS&G (17 September 2020) Remedial Work Plan (RWP), Penrith Central Park Village, Ref: 58140/132003 Rev A, referred to as the JBS&G (17 September 2020) Draft RWP.

The purpose of the current IA is to document Auditor findings following review of the interim results for pre-remediation investigation into soil vapour conditions and the proposed scope for the remedial works. The Auditor notes that, whilst a grid based soil vapour sampling within the source area of AEC1 was adopted, sampling only occurred in accessible areas and as such the extent of investigation did not achieve the density outlined in the SAQP (JBS&G, May 2020).

The JBS&G (18 September 2020) Draft RWP covers the following AECs as identified in the JBS&G (5 March 2019) Overarching Remedial Action Plan (Ref: 55073/120362 Rev 0), which was endorsed by the Auditor at the time of completion of the Section B Site Audit Statement (17124 SAS116, dated 18 April 2019): The RAP is referred to as the JBS&G (2019) Overarching RAP in this interim advice:

- AEC 1 – Chlorinated ethene impacted soil
- AEC 3 – Soils underlying transformer
- AEC 4 – Fill material underlying buildings and pavement

[1] In September 2017, Zoic was commissioned by Council to complete a Section B Site Audit (Zoic Ref: 19124) for the Central City Park development (for both the Future Park (western portion) and Developable Area (eastern portion)). At the end of the site audit, a Site Audit Statement (SAS) was issued, certifying that, in the opinion of the Auditor that the site can be made suitable for the proposed development if the site is remediated in accordance with the JBS&G (5 March 2019) Penrith Central Park Village Overarching Remedial Action Plan 114 to 146 Henry Street, 42 to 50 Station Street, and Allen Place Car Park (Ref: 55073/120362 Rev 0) subject to compliance with conditions as stated in the Site Audit Statement.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

It is noted that AEC 2 (former service station) is located outside of the proposed Penrith City Park development area.

In addition to the above documents, the following laboratory reports were also provided to the Auditor:

- Eurofins Draft Test Results – Report 722971
- Eurofins Test Results – Report 724112

These samples were collected from the stormwater system 'which runs along Gaymark Lane, crossing Henry Street and then going beside the tax office building'. It is understood that these samples were collected during the CCTV investigation of the existing drainage system, and that these results will be evaluated and reported by JBS&G at a later date as the investigation is ongoing. The Auditor has not conducted a review of the raw data.

3 Summary of Pre-remediation Assessment

The scope of investigation in AEC1 included the following:

- Installation of 16 sub-slab soil vapour pins (SS1 to SS9) across the northern portion of AEC, accessible area to the west of AEC 1 (SV12 to SV17) and within the proximity of the existing sewer pipe (SV18).
- Installation of 2 deep soil vapour probes (SV10 and SV11).
- All soil vapour samples collected from vapour pins and deep soil vapour probes were submitted to a NATA accredited laboratory for VOC 8260 analysis.
- Soil samples were collected during the installation of the 2 deep soil vapour probes to facilitate preliminary waste classification assessment. Selected samples were analysed for BTEX, PAH, TRH, OCP, PCB, VOC, heavy metals, asbestos (500mL), TCLP for PAH and ASLP for VOC.

4 Summary of Proposed Remedial Works

The proposed remedial works as outlined in the RWP includes:

- **Capping of asbestos impacted soils (AEC4)**, pending assessment of the type and extent of impact within the audit area. The preferred approach will require approval by the Auditor prior to implementation.
- **Chlorinated ethene impacted soils (AEC1)** will be remediated by:
  - Decommissioning of all underground utilities within the remediation area
  - Excavation and stockpiling of impacted soil within the remediation area. Excavated materials will be placed in 70m3 stockpiles which will then be assessed for suitability for onsite containment. Materials considered unsuitable for onsite containment will be disposed offsite.
  - The proposed containment cell will be located at least 30m lateral distance away from current and future offsite structures and located above the groundwater table (approx. 7mbgs).
- **Soils underlying transformers (AEC3)** will be subject to further assessment. The preferred remediation approach will require consideration and approval by the Auditor prior to implementation.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5 Review of JBS&G (18 September 2020) Draft Remedial Works Plan

The RWP prepared for the future Council park has been audited in accordance with the requirements outlined in EPA (2017) Contaminated Land Management Guidelines for the NSW Site Auditor Scheme (3rd edition), OEH (2011) Guidelines for Consultants Reporting on Contaminated Sites and with consideration of the amended NEPC (1999) National Environment Protection (Assessment of Site Contamination) Measure, Schedule A and Schedules B(1)-B(9) by National Environment Protection Council, Adelaide (April 2013).

A summary of the document review is presented in the following table.

Table 1: Summary of JBS&G (18 September 2020) Draft RWP

Requirement	Consultant Consideration	Auditor Comment
Objectives:	Section 1.2 states that the objectives of the remediation were to 'render the site suitable for the proposed use'. JBS&G further states that 'this RWP will be revised upon receipt of the additional investigation results proposed to be completed prior to remediation works as outlined in JBS&G (2020). '	Auditor notes: • Further data gap investigation to determine the extent of remedial works required for AEC 1 (chlorinated ethene impacted soils) is proposed • Fill material not accessible at the time of the JBS&G (2018) investigation, requires characterisation to determine whether it requires remediation **The draft RWP has only been prepared for AEC1, AEC3 and AEC4 on the basis that the 'extent' has not yet been fully determined.** **Delineation of groundwater impact and/or offsite migration is to be assessed as required by the Auditor as part of endorsing the Overarching RAP. There is a requirement for " delineation of the offsite extent of the groundwater contamination should be undertaken to ensure the extent of the groundwater contamination is known and can be managed during the future redevelopment of the land" as outlined in NSW EPA letter (4 July 2020) to Council.** **The RWP will be an evolving document as new information is obtained.**
Scope of work	Section 4 states that the scope includes: • Remediation of asbestos impacted soils, noting that further assessment will be required to determine the nature and extent of the remedial works • Remediation of chlorinated ethene impacted soils • Remediation and/or management of soils underlying transformer	Acceptable, noting further characteristion is required for AEC1, 3 and 4 as well as addressing groundwater.
Site identification	Section 2.1 provides site identification details.	Acceptable
Site history	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
Site condition and surrounding environment	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)
Remediation criteria	Soil remediation criteria have not been included as onsite containment is the preferred option. For chlorinated ethene impacted soil, ASLP results will be compared to ANZG (2018) for freshwater ecosystems protective of 95% of species. An attenuation factor of 10 will be applied to the applicable criteria before screening of the validation data given that the containment cell will be placed above the groundwater table and that surface water infiltration will largely eliminated through a GCL membrane or hardstand surface Section 6.1.2 states that 'validation criteria for the excavation extent is to be agreed with the site auditor prior to implementation'.	**Please refer to Section 7 for Auditor comments.**
Results	Tabulated results and figures have not been included. Section 4 discusses the results, which provide the following: • Asbestos (fill) • Chlorinated ethene impacted soils • Soils underlying transformers	**Please refer to Section 7**
Results of remediation pilot trials (if applicable)	Not proposed	Not applicable
Conceptual Site Model	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)
Remediation Option Assessment and Remediation Strategy		
Extent of remediation required as outlined in RAP	Section 4 provides the extent of the area requiring remediation, summarised below: • Based on the current data, the extent of remediation area for chlorinated ethene impacted soil (AEC 1) is approximately '650m2 over an average excavation depth of 1.5m and assuming a contingency factor of +50% for depth and/or lateral variation equates to an approximate volume of 1500m3 in situ'. Figure 3 shows the proposed extent of remediation for AEC 1. It is noted that the extent of remediation and/or management of fill material and soils underlying transformer are to be determined following completed of additional assessment.	**Figure 3 does not clearly indicate the extent of remediation proposed.** **Sec 4.2 states that the extent of remediation for AEC1 is not yet defined. The Auditor agrees - remediation may extend further along sewer lines and under buildings that could not be accessed for this round of assessment.** **The extent of asbestos impacted soils (AEC3) is unknown and further investigation is proposed by JBSG (as stated in Sec 4.1)**
Discussion of possible remediation options	Not provided.	Covered in JBS&G (2019) Overarching RAP.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
Selected remediation option	Section 5 states that onsite containment is the preferred remediation option. Materials deemed to be unsuitable to retain onsite will be removed for offsite disposal.	**Considered acceptable, pending additional delineation findings to confirm extent of impact, and confirmation of contaminant behaviour if capped**
Rationale for selected remedial option	Not provided.	Covered in JBS&G (2019) Overarching RAP. Any capping will require a long term Environmental Management Plan (LTEMP). **Groundwater quality requires further assessment which may change the RWP and remedial strategy implemented.**
Description of remediation works:	Section 5 provides description of the remediation works for: • Asbestos impacted soil: • Preferred remediation approach to be determined following completion of additional works. At this stage, a cap and contain is the preferred option. Impacted soil is to be placed beneath a capping layer, with cap thickness of at least 0.5m. A marker layer will be installed prior to placement of the capping layer. • Chlorinated ethene impacted soils • Complete the remainder of pre-remediation investigation to determine the extent of remediation area • Excavate underground utilities, followed by impacted soils within the remediation area. • Materials are to be stored in 70m3 stockpiles for further testing to determine suitability for onsite retention. Unsuitable material will be disposed offsite. • Materials to be retained will be consolidated into a single stockpile prior to final placement within an onsite containment cell. The cell will be at least 30m away from current and future structures and located above the groundwater table. • The cell will be located under future hardstand or placed under a geosynthetic clay liner with a hydraulic conductivity of less than $5x10^{-11}$m/s. A marker layer will be placed prior to the placement of a capping layer of at least 0.5m thick. • Soils underlying transformers will be tested to determine the extent of remediation area (if required).	**Please refer to Section 7 for further comments. The is no consideration for groundwater?**
Validation plan	Section 6 provides validation testing requirement, which includes: • Asbestos impacted soil – to be determined following completion of additional testing. • Chlorinated ethene impacted soils – validation of excavations	**Please refer to Section 7 for further comments.**

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
	- Boreholes will be advanced to facilitate soil vapour probe installation. Probes will be installed to a depth of 1m within the walls or base of excavation. - Soil vapour probes will be left to equilibrate for period of 24 hours prior to sampling. - Probes will be purged using a multi-gas meter for at least 30s. - Leak detection evaluation via placement of an isopropyl alcohol-soaked rag - Sampling will be conducted using a carbon tube via a telfon tubing. - Sampling density will be based on a 10m grid. • Chlorinated ethene impacted soils – validation of suitability for onsite containment - Samples will be collected at a frequency of 70m3 and tested for ASLP. • Validation of soil containment - A location plan with co-ordinates relative to the lot boundaries - The levels in m AHD of the upper surface of the impacted fill materials - Daily inspections by the environmental consultant to record when and where the GCL and marker layer has been installed - The levels in m AHD of the finished barrier layer surface. - Site surveys are to be prepared by a registered surveyor.	
Contingency plan if selected remedial strategy fails	Not provided.	**No contingency presented for groundwater. Further assessment is required as confirmed by NSW EPA.**
Unexpected finds protocol:	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Interim site management plan before remediation	Not provided.	**As conditioned by the Section B SAS, Interim environmental monitoring is to be carried out as described in the JBS&G (5 March 2019) Interim Environmental Monitoring Plan for Shop 3, 140 Henry Street as per the stated frequency up until demolition and remediation of the site commences to ensure no unacceptable exposure to contaminants of concern within indoor air occur. Please confirm that this is occurring and the monitored risk is acceptable.**
Site management plan for remediation works	Not provided	Covered in JBS&G (2019) Overarching RAP.
Regulatory compliance requirements	Not provided.	Covered in JBS&G (2019) Overarching RAP.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
Contact persons	Not provided.	Covered in JBS&G (2019) Overarching RAP but to be updated as the RWP evolves and contractors are appointed.
Community relations (where applicable)	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Staged progress reporting (where applicable)	Not provided	It is understood staged progress reporting is not required.
Environmental management plan requirement	Section 6.3 provides details of requirement of ongoing environmental management plan requirements.	**The Auditor will require the following prior to endorsement of the final LTEMP:** • **Where will the LTEMP be recorded? How will this LTEMP be publicly notified?** • **Mechanism of enforceability is to be clearly stated. Written confirmation of the mechanism is to be provided to the Auditor.** • **Responsibilities – who will be implementing the LTEMP, duties and roles for each party are required to be clearly stated.**
Waste Management		
Waste classification:	Section 5.4 states that waste classification is to be conducted in accordance with NSW EPA (2014) Waste Classification Guidelines.	Acceptable
Material handling and tracking plan:	Not provided.	Covered in JBS&G (2019) Overarching RAP.

6 Auditor Comments

The Auditor has reviewed the JBS&G (18 September 2020) Draft Pre-Remediation Investigation Report and the JBS&G (18 September 2020) Draft RWP against relevant guidelines made or approved by NSW EPA. The reports largely meet the guideline requirements, however, the Auditor provides the following comments:

6.1 JBS&G (18 September 2020) Draft Pre-Remediation Investigation Report

1. General comment: The Auditor notes that the pre-remediation investigation has not been fully completed as per the SAQP due to parts of AEC 1 being occupied and inaccessible. The investigation will be completed once access is obtained. AEC3 and AEC4 also remain as data gaps however, the RWP provides information on how these can be addressed to achieve site suitability.
2. Section 5.1.4 (Define the Study Boundary): JBS&G states that 'the temporal boundaries of this investigation were limited to the period of assessment works. Levels of chlorinated ethenes in soil and soil vapour are not considered sensitive to seasonal influences'. Please provide additional evidence to support this statement (ie, soil vapour concentrations not sensitive to seasonal influences) and that results are representative of worst case scenario (ie,

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

conditions favourable for soil vapour generation). Please discuss weather conditions during the two sampling events.

3. Section 5.2 / Figure 5 (sub-slab / soil vapour assessment): Please confirm the location of SV10. This is not shown in Figure 5. Based on the result table, it appears that SV10 was installed next to SS1.
4. Section 7 (QA/QC):
   a. It is noted that a triplicate sample QA01 was collected, but not included in the tabulated.
   b. Please provide a detailed QA/QC assessment in the final report. It is noted that the field QA/QC RPDs have not been calculated.
5. Section 10 (site characterisation): This section should be updated following the pre-remediation investigation. The draft RWP should also be updated to confirm the extent of remediation area for AEC 1.
6. Appendix D (calibration record): Please provide the calibration record for the GFM500 used during the fieldwork.

<u>JBS&G (18 September 2020) Draft RWP</u>

7. General comment: Please address **comments** in Table 1 of this interim advice.
8. Section 1.2 (objectives): The Auditor notes that this Draft RWP will be revised after completion of the pre-remediation investigation, and as such is considered an evolving document.
9. Section 4.1 (asbestos):
   a. Is JBS&G referring to AEC 4 in the JBS&G (2019) Overarching RAP? The Auditor notes that AEC 4 includes fill material that is currently under buildings which was not assessed at the time of the BS&G (2018) DGI. Please confirm.
   b. If this is a separate AEC, the Auditor agrees with JBS&G's proposal to prepare a sampling plan for asbestos assessment. Combining the investigations for AEC 4 and asbestos assessment is considered acceptable.
10. Section 4.2 (chlorinated ethene impacted soils): It is noted that the trenches created from the excavation of the underground utilities should also be included as part of the remediation area.
11. Section 5.1 (asbestos impacted soils): While noting that the preferred remediation approach will be finalised following completion of the investigation, the following should be taken into consideration:
    a. Should cap and contain be adopted as the preferred approach (particularly for retained asbestos impacted material), the minimum cap thickness should be at least 1m, given the site will be used as a recreational park, in line with WA DoH (2009) recommendation for public open space.
    b. Plantings are anticipated to be included as part of the park construction, which should be taken into consideration when deciding the location of the containment cell. This was discussed in the JBS&G (2019) Overarching RAP.
    c. Detail of the final finishing around services will need to be provided in the revised RWP.
12. Section 5.2.3 (onsite containment):
    a. If the containment cell is to be located beneath hardstand, it will have to be away from current and future service trenches.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

b. Please clarify the reference to $5x10^{-11}$m/s for the clay liner. Is this a product performance specification? If so, please include the specification in the revised RWP.

c. How is the GCL going to be installed? Installation methodology should be included in the revised RWP. Depending on the type of the GCL selected for the site, it may require to be kept moist (the bentonite) to maintain the barrier. Please keep this in mind when designing the containment cell and the cap.

13. Section 5.4 (materials management principal): JBS&G states that 'details of completed additional assessment activities including material characterisation reports will be included in the final validation documentation to be prepared in accordance with the requirements of the RAP JBS&G (2019a)'. The Auditor requires results of the additional assessment activities to be provided for review prior to finalisation of the RWP and not left to the validation reporting.

14. Section 6.1.2 (validation of chlorinated ethene impacted soils): The proposed validation sampling methodology is not consistent with the methodology in the JBS&G (2019) Overarching RAP, which was endorsed by the Auditor in 2019.

    a. Validation of excavation: JBS&G (2019) proposed field screening to be conducted at a density of 1 wall sample per 5 linear metre and 1 base sample per 25m2. Field screening is not included in the Draft RWP. Samples will be analysed and compared to HIL-C. Please justify deviation.

    b. Validation of the final site surface: JBS&G (2019) proposed that upon backfilling the remedial excavation and establishment of approximate final site levels, the final site-surface vapour concentrations will require validation. It is anticipated that final site levels will comprise exposed soils/garden beds. On that basis, validation will require to be undertaken by installation of either permanent or temporary soil-vapour wells on an approximate 10 m grid across the remedial excavation footprint. The vapour probes shall be installed to target soils no deeper than 1 m below the final site levels. A minimum of two rounds of soil-vapour sampling will be conducted per the requirements of the VSAQP. Samples of soil-vapour will be withdrawn from each soil vapour well and submitted for laboratory analysis. Please clarify.

    c. Endorsed analytical suite for soil vapour is VOC 8260 and TRH. ASLP is also to be analysed from soil samples collected from excavation. Please clarify.

    d. Site validation criteria: Section 8.7 JBS&G (2019) details the site validation criteria. Please confirm whether they will be adopted, or provide justification for any deviation. In addition, it is noted that JBS&G proposes 'the validation criteria will be sourced from values provided to ANZG (August 2018) for fresh water ecosystems protective of 95% of species. An attenuation factor of 10 will be applied to the applicable criteria before screening of the validation data given that the containment cell will be placed above the groundwater table and that surface water infiltration will largely eliminated through a GCL membrane or hardstand surface'. This deviates from the endorsed criteria. Please provide clarification why an attenuation factor of 10 was selected. Is this in ANZG?

15. Section 6.1.4 (validation of soil containment): Surveys are required as per Section 8.7.4 JBS&G (2019). Validation report should contain information as described in Section 8.2.6.4 in the JBS&G (2019) Overarching RAP, at a minimum.

16. Section 6.3 (LTEMP): The Auditor will require the following prior to endorsement of the final LTEMP:

    a. Where will the LTEMP be recorded? How will this LTEMP be publicly notified?

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

b. Mechanism of enforceability is to be clearly stated. Written confirmation of the mechanism is to be provided to the Auditor.

c. Responsibilities – who will be implementing the LTEMP, duties and roles for each party are required to be clearly stated.

17. General comment: It is assumed that sampling methodology, QA/QC, decontamination etc, will be conducted as per the JBS&G (2019) Overarching RAP. Please confirm

We request that JBS&G provide responses to the above comments, together with an amended copy of the revised Pre-Remediation Investigation Report and RWP, as appropriate.

7 Closure

This interim advice does not constitute a SAS or a SAR, but rather is provided to assist the Client in the assessment and management of contamination issues at the site. The information provided herein should not be considered pre-emptive of the final Audit conclusions. It represents the Auditor's opinion based on the review of currently available information.

Should you have any queries or wish to discuss any points, please do not hesitate to contact Fiona Wong or the undersigned.

Yours sincerely,

Rebeka Hall
NSW EPA Accredited Site Auditor

CC: Wasique Mohyuddin
Major Projects Coorinator
Penrith City Council
Via email: wasique.mohyuddin@penrith.city

Summary of Responses to Interim Advices No. 03
Penrith Central Park Village

Dear Rebeka,

JBS&G Australia Pty Ltd (JBS&G) has been engaged by Penrith City Council (Penrith, the client) to provide environmental consultancy services associated with the proposed redevelopment of the Penrith City Village Park (PCPV). JBS&G has recently been in receipt of:

- Interim Advice 1 (IA3) – Review of Draft Pre-Remediation Investigation and Remedial Work Plan (RWP), Penrith City Park, NSW, 23 October 2020, Zoic Environmental Pty Ltd (Zoic 2020).

Responses to each of the issues raised in the interim advice are detailed following. A revised copy of the Draft Pre-Remediation Investigation (JBS&G 2020a[1]) and Remedial Work Plan (JBSG 2020b[2]) has been prepared consistent with the scope of the actions to address each of the comments in IA3.

IA3 – Draft Pre-Remediation Investigation Report

1. *General comment: The Auditor notes that the pre-remediation investigation report has not been fully completed as per the SAQP due to parts of AEC1 being occupied and inaccessible. The investigation will be completed once access is obtained. AEC3 and AEC4 also remain as data gaps however, the RWP provides information on how these can be addressed to achieve site suitability.*

Comment noted. The investigation of AEC1 will be completed in accordance with the SAQP prior to remediation works, once access is obtained. The RWP has been further updated to provide commentary on the how the data gaps of AEC3 and AEC4 will be addressed following demolition works in which a separate SAQP will be prepared and issued to the Auditor for review prior to sampling works.

2. *Section 5.1.4 (Define the Study Boundary): JBS&G states that 'the temporal boundaries of this investigation were limited to the period of assessment works. Levels of chlorinated ethenes in*

[1] Draft Pre-Remediation Investigation, Penrith Central Park Village, 134 to 144 Henry Street, 42 to 50 Station Street and Allen Place Car Park, JBS&G Australia Pty Ltd, 17 September 2020 (JBS&G 2020a).
[2] Remedial Work Plan, Penrith Central Park Village, 134 to 144 Henry Street, 42 to 50 Station Street and Allen Place Car Park, JBS&G Australia Pty Ltd, 17 September 2020 (JBS&G 2020b).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

soil and soil vapour are not considered sensitive to seasonal influences'. Please provide additional evidence to support this statement (ie, soil vapour concentrations not sensitive to seasonal influences) ad that results are representative of worst case scenario (i.e, conditions favourable for soil vapour generation). Please discuss weather conditions during the two sampling events.

Section 5.1.4 has been updated – seasonal influences are not considered to have a significant impact on the outcomes of the assessment given that the objective of the investigation was to delineate the extent of CE impacted source material within site soils that will require remediation and not assess potential worst case conditions as applicable to vapour intrusion. It is further noted that additional vapour sampling will be undertaken during remediation and subsequent validation activities.

3. *Section 5.2 / Figure 5 (sub-slab / soil vapour assessment): Please confirm the location of SV10. This is not shown in Figure 5. Based on the result table, it appears that SV10 was installed next to SS01.*

Confirming that SV10 was installed adjacent to SS01. Figure 5 has been updated.

4. *Section 7 (QA/QC):*

    a. *It is noted that a triplicate sample QA01 was collected, but not included in the tabulated.*

The results from QA01 (split duplicate sample for SS09) have now been included in Table C. It is noted that the analytical suite on carbon tubes from Envirolab reports less compounds than the primary laboratory Eurofins – however this is not considered to affect the outcomes of the assessment given that the two primary COPCs (TCE and PCE) were reported by both laboratories.

    b. *Please provide a detailed QA/QC assessment in the final report. It is noted that the field QA/QC RPDs have not been calculated.*

Comment noted and agreed – a detailed QA/QC assessment will be completed in the final report, once all the proposed data has been collected. No changes to draft reports.

5. *Section 10 (site characterisation): This section should be updated following the pre-remediation investigation.*

Comment noted. Upon finalisation of the pre-remediation investigation report (following the additional sampling proposed once complete access is gained) the extent of required remediation for AEC1 will be clearly defined in Section 10 as well as the RWP. No changes to draft reports.

6. *Appendix D (calibration record): Please provide the calibration record for the GFM500 used during fieldwork.*

The calibration record has now been provided in Appendix D for the GFM500.

RWP

7. *General comment: Please address comments in Table 1 of this interim advice.*

<u>Comments with Respect to Groundwater</u>

Based on a review of Figure 4b, the extent of CE impacts within groundwater have not been delineated to the north-west of AEC1 (i.e. 129-133 Henry Street). Further delineation of CE impacted groundwater to the north-west of the site will be required to confirm that the CE impacts in groundwater do not pose an unacceptable risk to human health or the environment as consistent with the historical off-site investigation findings to the north of AEC1 (i.e. within 129-133 Henry Street and beyond). It is proposed to prepare an SAQP for the delineation of off-site groundwater impacts that also covers the sampling required for potential impacts associated with AEC3 and AEC4.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The SAQP will be prepared and issued to the Auditor for review prior to sampling works and will be undertaken during demolition works. Noting that the greatest CE impacts within groundwater (located at JBMW02 – PCE 0.15 mg/L) have likely already been identified, it is considered highly unlikely that the extent of the plume will affect the on-site remediation works proposed in the RWP – where the ongoing source of CE impacts to groundwater will be appropriately remediated. The overarching RAP (JBS&G 2019) provides further contingencies in the unlikely event that the preferred remedial option outlined in the RWP

Interim environmental monitoring within Shop 3, 140 Henry Street

All interim environmental monitoring within Shop 3 was completed at the required frequency. No unacceptable health risks were identified to occupants of the building. It is noted that the shop was recently vacated and that the monitoring has now ceased.

8. *Section 1.2 (objectives): The Auditor notes that this Draft RWP will be revised after completion of the pre-remediation investigation, and as such is considered an evolving document.*

Comment noted and agreed.

9. *Section 4.1 (asbestos):*

    a. *Is JBS&G referring to AEC 4 in the JBS&G (2019) Overarching RAP? The Auditor notes that AEC4 includes fill material that is currently under buildings which was not assessed at the time of JBS&G (2018) DGI. Please confirm.*

Section 4.1 has been updated to confirm that potential asbestos and other COPCs within fill materials that have not been completely assessed is related to AEC 4 in the RAP.

    b. *If this is a separate AEC, the Auditor agrees with JBS&G's proposal to prepare a sampling plan for asbestos assessment. Combining the investigations for AEC4 and asbestos assessment is considered acceptable.*

Comment noted and agreed.

10. *Section 4.2 (chlorinated ethene impacted soils): It is noted that the trenches created from the excavation of the underground utilities should also be included as part of the remediation area.*

Figure 3 has been updated to include the remediation of the sewer – noting that the extent of remediation required around underground utilities will not be known until the trenches are exposed during demolition/remediation works.

11. *Section 5.1 (asbestos impacted soils): While noting that the preferred remediation approach will be finalised following completion of the investigation, the following should be taken into consideration:*

    a. *Should cap and contain be adopted as the preferred approach (particularly for retained asbestos impacted material), the minimum cap thickness should be at least 1 m, given the site will be used as a recreational park, in line with WA DOH (2009) recommendation for public open space.*

Comment noted. Section 5.1 has been updated to include the requirement for a minimum thickness of 1.0 m capping layer.

    b. *Plantings are anticipated to be included as part of the park construction, which should be taken into consideration when deciding the location of the containment cell. This was discussed in the JBS&G (2019) Overarching RAP.*

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The approximate location of the proposed containment cell is now provided in Figure 4 – where it is noted that the final site surface will be covered in lawn with limited potential for the root systems to extend beyond the depth of the capping layer.

c. *Detail of the final finishing around services will need to be provided in the revised RWP.*

The location of the proposed in ground services is now provided in Figure 4 – where it is not anticipated that they will extend through any potential impacted soils. Notwithstanding, the final dot point in Section 4.1 has been updated to include the requirement to include a marker layer within the base and walls of a service trench – in the unlikely event that it extends through asbestos impacted soils.

12. *Section 5.2.3 (onsite containment):*

    a. *If the containment cell is to be located beneath hardstand, it will have to be away from current and future service trenches.*

Comment noted and agreed. All future service trenches are shown on Figure 4 and the containment cell will be placed outside of these alignments.

    b. *Please clarify the reference to $5x10^{-11}$ m/s for the clay liner. Is this a product performance specification?*

EPA Environmental Guidelines for Solid Waste Landfills 2016 (EPA 2016) recommends a sealing layer with a hydraulic conductivity of less than $1x10^{-9}$ m/s to minimise surface water infiltration into solid waste landfills and the subsequent generation of leachate. The RWP has conservatively recommended a GCL product (Bentofix in which the product specifications are now provided as Appendix A) with a hydraulic conductivity of $5x10^{-11}$ m/s to further minimise surface water infiltration and minimise the generation of leachate through the containment cell.

    c. *How is the GCL going to be installed? Installation methodology should be included in the revised RWP. Depending on the type of GCL selected for the site, it may require to be kept moist (the bentonite) to maintain the barrier. Please keep this in mind when designing the containment cell and the cap.*

The proposed GCL membrane product specifications are provided in Appendix A. The GCL layer is required to be installed in accordance with the manufacturer's instructions with appropriate overlay of 150-300 mm between joints of the GCL. Care will be taken to ensure that there are no cuts/abrasions during installation of the GCL – however it is noted that the product is self-healing and minor cuts/openings will appropriately ameliorate. In addition, Bentofix does not require to be kept most during installation and/or maintenance. The environmental consultant will be required to visually inspect the installation of the GCL and marker layers and provide photographic evidence that it was appropriately installed for inclusion in the validation report. Sections 5.2.3 and 6.1.4 have been updated.

13. *Section 5.4 (materials management principle): JBS&G states that 'details of completed additional assessment activities including material characterisation reports will be included in the final validation documentation to be prepared in accordance with the requirements of the RAP (2019a)'. The Auditor requires results of the additional assessment activities to be provided for review prior to finalisation of the RWP and not left to the validation reporting.*

All sampling results from subsequent pre-remediation investigations will be forwarded to the Auditor for review prior to finalisation of the RWP. However, Section 5.4 is primarily intended for any potential materials that may require off-site disposal (as a result of an unexpected find and/or due to been surplus to site development requirements) during remediation/civil construction works that will be unknown prior to the finalisation of the RWP.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

14. *Section 6.1.2 (validation of chlorinated ethene impacted soils): The proposed validation sampling methodology is not consistent with the methodology in the JBS&G (2019) Overarching RAP, which was endorsed by the Auditor in 2019.*

    a. *Validation of excavation: JBS&G (2019) proposed field screening to be conducted at a density of 1 wall sample per 5 linear metre and 1 base sample per 25 m^2. Field screening is not included in the Draft RWP. Samples will be analysed and compared to HIL-C. Please justify deviation.*

Section 6.1.2 has been updated to be consistent with Section 8.2.6.1 of the RAP (JBS&G 2019) – in which the required field screening, soil and soil vapour sampling is outlined.

    b. *Validation of the final site surface. JBS&G (2019) proposed that upon backfilling the remedial excavation and establishment of approximate final site levels, the final site surface vapour concentrations will require validation. It is anticipated that final site levels will comprise exposed soils/garden beds. On that basis, validation will require to be undertaken by installation of either permanent or temporary soil-vapour wells on an approximate 10 m grid across the remedial excavation footprint. The vapour probes shall be installed to target soils no deeper than 1 m below the final site levels. A minimum of two rounds of soil-vapour sampling will be conducted per the requirements of the VSAQP. Samples of soil-vapour will be withdrawn from each soil vapour well and submitted for laboratory analysis. Please clarify.*

All remedial excavations within AEC1 will be subject to validation sampling (as per Section 6.1.2) and subsequently backfilled with clean materials. In addition, no buildings/structures will be constructed in this portion of the site, where vapour intrusion could potentially occur. As such, it is considered unnecessary to complete validation sampling of the final site surface within the footprint of AEC1.

    c. *Endorsed analytical suite for soil vapour is VOC8260 and TRH. ASLP is also to be analysed from soil samples collected from excavation. Please clarify.*

The validation (for remedial excavations of AEC1) analytical suite for soil vapour will comprise VOC8260 and TRH. In addition, soil samples will be analysed for total VOCs and if there are detectable concentrations of CEs within the sample, will be scheduled for ASLP VOCs for comparison to ANZG (2018) validation criteria.

    d. *Site validation criteria: Section 8.7 JBS&G (2019) details the site validation criteria. Please confirm whether they will be adopted, or provide justification for any deviation. In addition, it is noted that JBS&G proposed 'the validation criteria will be sourced from values provided to ANZG (August 2019) for freshwater ecosystems protective of 95% of species. An attenuation factor of 10 will be applied to the applicable criteria before screening of the validation data given that the containment cell will be placed above the groundwater table and that surface water infiltration will largely eliminated through a GCL membrane or hardstand surface'. This deviates from the endorsed criteria. Please provide clarification why an attenuation factor of 10 was selected. Is this in ANZG?*

The site validation criteria will be consistent with Section 8.7 of the RAP (JBS&G 2019) unless a subsequent quantitative risk assessment is completed in order to derive site specific validation criteria subject to Auditor review and endorsement. In addition, the attenuation factor of 10 has been removed for comparison of leachate analysis (in soils proposed to be retained on site) to ANZG (2018) in order to maintain sufficient conservatism within the remedial approach.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

15. *Section 6.1.4 (validation of soil containment): Surveys are required as per Section 8.7.4 JBS&G (2019). Validation report should contain information as described in Section 8.2.6 in the JBS&G (2019) Overarching RAP, at a minimum.*

Comment noted. Section 6.1.4 has been updated to include survey requirements as consistent with Section 8.7.4 of JBS&G (2019). In addition, Section 6.2 has been updated to make it clear that any relevant survey information will be required to be included in the validation report.

16. *Section 6.3 (LTEMP): The Auditor will require the following prior to endorsement of the final LTEMP:*
    a. *Where will the LEMP be recorded? How will this LTEMP be publicly notified?*
    b. *Mechanism of enforceability is to be clearly stated. Written confirmation of the mechanisms is to be provided to the Auditor.*
    c. *Responsibilities – who will be implementing the LTEMP, duties and roles for each party are required to be clearly stated.*

Comments noted and agreed. It is anticipated that the LTEMP will be included on the Council 10.7 planning certificates and be made legally enforceable by appropriate notification to the regulatory authority (Council). Council as the landowner will be responsible for appropriately implementing the LTEMP.

17. *General comment: It is assumed that sampling methodology, QA/QC decontamination etc, will be conducted as per the JBS&G (2019) Overarching RAP. Please confirm.*

It is confirmed that all procedures with respect to each of these aspects will be consistent with JBS&G (2019).

Should you require clarification, please contact the undersigned on 02 8245 0300 or by email cbielby@jbsg.com.au.

Yours sincerely:

Attachment 1 – Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquiries.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

Dear Wasique,

Re: Interim Advice 1 (IA4) – Review of Revised Draft Pre-Remediation Investigation and Remedial Work Plan (RWP), Penrith City Park, NSW

1 Introduction

Penrith City Council (Council) has commissioned Rebeka Hall of Zoic Environmental Pty Ltd (Zoic), a NSW EPA Auditor accredited (No.0802) under the Contaminated Land Management (CLM) Act 1997, to conduct an Audit for the proposed Penrith City Park located at the corner of Henry and Station Streets, Penrith NSW ("the site"). The future park 'site' is legally identified as:

- Lot 1 in DP254763 – Henry Street (to be west of Lot 1 in DP113118)
- Lot 1 in DP164798 and Lot 1 in DP252457 – 134-138 Henry Street
- Lot 10 and 11 in DP553665 – 142 Henry Street
- Lot 2 in DP 556075 – 144 Henry Street
- Lot 3 in DP1200790 – 42 to 44 Station Street
- Lot 1 in DP 526304 – 48 to 50 Station Street
- Lot E DP 163176 – 46 Station Street
- Western portion of Allen Place Car Park, Gaymark Lane and Allen Place (no lot and DP available)

The site occupies an area of approximately 7,500m^2 and is currently used as commercial, retail and car parking area.

The proposed development will comprise a large open recreational space, consisting a mixture of paved and grassed areas including shallow/deep planted gardens and potentially raised garden boxes.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The aim of the Audit engagement is to enable a site audit statement (SAS) and associated site audit report (SAR) to be prepared that confirms the suitability of the site for the proposed open recreational space at the completion of remedial works. This audit is being conducted in accordance with the requirements outlined in the NSW EPA (2017) Contaminated Land Management Guidelines for the NSW Site Auditor Scheme (3rd edition).

2 Current Interim Advice

The Auditor had previously issued IA1 (9 April 2020) and IA2 (11 May 2020) on the JBS&G Sampling Analysis and Quality Plan (SAQP). The JBS&G (1 May 2020) SAQP was prepared for the pre-remediation assessment of soil underlying 134-138 and 140 Henry Street, referred to as Area of Environmental Concern 1 (AEC1). This was a requirement of the Auditor endorsed Remediation Action Plan (RAP)[1].

The objective of the pre-remediation assessment was to inform the extent of remediation required for AEC1. AEC1 is the portion of the site impacted by contaminants associated with former dry-cleaning operations. The other 3 AECs (AEC2-former service station to the east; AEC3-soils under transformers; AEC4-unknown quality of fill material underlying buildings and pavement) identified in the RAP do not form part of the current pre-remediation assessment.

After the finalisation of the SAQP, JBS&G commenced the pre-remediation assessment of AEC1 aimed at determining the extent of remediation required. As some of the commercial/retail shops were occupied at the time of their investigation the complete scope of fieldwork could not be completed.

JBS&G prepared the Draft Pre-remediation Investigation Report (dated 17 September 2020) based on the works achieved and the Draft Remedial Action Plan (dated 17 September 2020), which the Auditor had reviewed and provided comments in IA3 (23 October 2020).

In preparing this interim audit advice, the Auditor has reviewed the following updated and revised documentation:

- JBS&G Australia Pty Ltd (JBS&G, 8 December 2020) Pre-Remediation Investigation, Penrith Central Park Village, Ref: 58140/131749 Rev B.
- JBS&G (8 December 2020) Remedial Work Plan (RWP), Penrith Central Park Village, Ref: 58140/132003 Rev B, referred to as the JBS&G (8 December 2020) Revised Draft RWP.
- JBS&G (8 December 2020) Summary of Responses to Interim Advice No 3, Penrith Central Park Village, Ref: 58140-134,227.

The purpose of the current IA is to document Auditor findings following review of the Revised Draft documents and JBS&G's response to IA3. The Auditor notes that no additional works were conducted since the issue of the original JBS&G (18 September 2020) Draft Pre-remediation

[1] In September 2017, Zoic was commissioned by Council to complete a Section B Site Audit (Zoic Ref: 19124) for the Central City Park development (for both the Future Park (western portion) and Developable Area (eastern portion)). At the end of the site audit, a Site Audit Statement (SAS) was issued, certifying that, in the opinion of the Auditor that the site can be made suitable for the proposed development if the site is remediated in accordance with the JBS&G (5 March 2019) Penrith Central Park Village Overarching Remedial Action Plan 114 to 146 Henry Street, 42 to 50 Station Street, and Allen Place Car Park (Ref: 55073/120362 Rev 0) subject to compliance with conditions as stated in the Site Audit Statement.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Investigation Report. It is understood that the works will resume in February 2021 when the remainder of the tenants vacant the site.

The JBS&G (8 December 2020) Revised Draft RWP covers the following AECs which were identified in the JBS&G (5 March 2019) Overarching Remedial Action Plan (Ref: 55073/120362 Rev 0), and which was endorsed by the Auditor with the Section B Site Audit Statement (17124 SAS116, dated 18 April 2019): The RAP is referred to as the JBS&G (2019) Overarching RAP in this interim advice:

- AEC 1 – Chlorinated ethene impacted soil
- AEC 3 – Soils underlying transformer
- AEC 4 – Fill material underlying buildings and pavement

It is noted that AEC 2 (former service station) is located outside of the proposed Penrith City Park development area.

3 Review of JBS&G (8 December 2020) Revised Draft Remedial Works Plan

The JBS&G (8 December 2020) Revised Draft RWP has been audited in accordance with the requirements outlined in EPA (2017) Contaminated Land Management Guidelines for the NSW Site Auditor Scheme (3rd edition), Consultants Reporting on Contaminated Land Contaminated Land – Contaminated Land Guidelines and with consideration of the amended NEPC (1999) National Environment Protection (Assessment of Site Contamination) Measure, Schedule A and Schedules B(1)-B(9) by National Environment Protection Council, Adelaide (April 2013). A summary of the document review is presented in Table 1 attached.

4 Auditor Comments

The Auditor has reviewed the JBS&G (8 December 2020) Revised Draft Pre-Remediation Investigation Report, JBS&G (8 December 2020) Revised Draft RWP and JBS&G (8 December 2020) JBS&G Response to IA03 against relevant guidelines made or approved by NSW EPA. The reports largely meet the guideline requirements, however, the Auditor provides the following comments:

4.1 Overall Comment

1. General comment (site boundary): The Auditor notes that the site boundary in the JBS&G (8 December 2020) Revised Draft Pre-Remediation Investigation Report and JBS&G (8 December 2020) Revised Draft RWP have been revised since the issue of the last draft reports. It is noted that the new boundary is still within the Audit Boundary covered by the Section B site audit issued by the Auditor in 2019 (SAS No SAS116). Therefore, the endorsed JBS&G (2019) Overarching RAP applies to the new site boundary.

4.2 JBS&G (8 December 2020) Revised Draft Pre-remediation Investigation Report

2. Section 5.1.4 (define the study boundary): The Auditor does not agree with JBS&G's response to IA3 with respect to seasonal influences on investigation activities. Soil vapour conditions are affected by changes in climatic conditions. At the end of all sampling activities, the Auditor requires JBS&G to provide evidence to confirm results monitored are representative of worst case scenario.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3. Appendix D (calibration certificate): It is noted that the gas analyser used is a GFM435. Please ensure a correct calibration certificate is included in the final report, or the correct equipment is referenced in the main text. Section 5.2.3 states that a GFM500 was used.

4.3 JBS&G (8 December 2020) Revised Draft RWP

4. Section 5.2.3 (onsite containment): The specification provided in Appendix A states that the hydraulic conductivity is 1 x 10^{-14} m/s, not 5 x 10^{-11} m/s. The specification attached appears to contain several different Bentofix grade. Please specify which product JBS&G is proposing to use in the Final RWP.

   With respect to geofabric marker layer, WA DoH 2009 states that it must be: water permeable; high visibility; rot proof and chemically inert; and high tensile strength.

   The above information should be included in the Final RWP.

5. Section 6.1.2 (validation of chlorinated ethene impacted soils): The Auditor has reviewed this section and notes the following:

   a. Final extent of excavation will be informed by a combination of soil and soil vapour sampling. JBS&G states that works to be conducted as per Section 8.2.6.1 in the JBS&G (2019) however, the following discrepancies were noted:

      i. Temp soil vapour probes were proposed to be installed at a rate of 1 per 5m excavation wall, with a min of 1 per wall; and at a rate of 1 per 25m2 base, with a minimum of 4 per excavation. This has not been included in the JBS&G (2020) Revised RWP.

      ii. In JBS&G (8 December 2020) JBS&G Response to IA3, JBS&G considers that the final site surface is no longer required to be validated within footprint of AEC 1 as 'all remedial excavations within AEC1 will be subject to validation sampling (as per Section 6.1.2) and subsequently backfilled with clean materials. In addition, no buildings/structures will be constructed in this portion of the site, where vapour intrusion could potentially occur'.

   The Auditor requires the final validation sampling densities to be confirmed in the Final RWP, following completion of the pre-remediation investigations on determining the final extent of remediation for this AEC and the final location of the containment area.

The above comments are to be incorporated by JBS&G into conducting future site delineation works and in finalising the RWP.

5 Auditor Conclusions

The Auditor considers that the JBS&G (8 December 2020) Revised Draft RWP provides an adequate remedial strategy for the contamination confirmed at the site, to be implemented with the endorsed JBS&G (2019) Overarching RAP, subject to the following conditions:

1. Completion of the remaining pre-remediation investigations and groundwater assessment following site vacation in February 2021. A SAQP is to be provided to the Auditor for review prior to the commencement of the following:

   a. Delineation of chlorinated ethene groundwater contamination and offsite migration

   b. Assessment of fill material under buildings (AEC 4), which should be designed based on the sampling plan as described in Section 7.6.3 of the JBS&G (2019) Overarching RAP and observation made on site surface following removal of existing hardstand onsite (AEC4),

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

including the concrete slab within the western portion of Allen Place carpark which is now part of the site.

2. Upon completion of the Pre-remediation investigation works, a copy of the final draft report is to be submitted to the Auditor for review. The report should include a complete set of data gap investigations and findings of the investigation.
3. The JBS&G (8 December 2020) Revised Draft RWP is to be updated and finalised following completion of the pre-remediation investigations and reporting. The Auditor requires the following information to facilitate the review:
   a. Confirmation of the final extent of remedial works for each AEC that is required to achieve the remedial goals
   b. Preferred remedial option for each AEC. For chlorinated ethene impacted soils (AEC 1), validation sampling and cap and contain strategy are to be presented.
   c. Final validation plan for each AEC, final site layout and final location of the containment area.
   d. Any deviation to the endorsed site validation criteria, as described in Section 8.7 of the JBS&G (2019) Overarching RAP will require to be submitted to the Auditor for endorsement for approval in advance.
4. Should a cap and contain strategy be adopted at the site, a Long Term Environmental Management Plan (LTEMP) will be required. Mechanism of enforceability and public notification will need to be confirmed and clearly stated in the LTEMP.
5. No remediation works are to commence without completion of remaining pre-remediation investigations and the finalisation of the Remedial Works Plan being endorsed by the Auditor.

6 Closure

This interim advice does not constitute a SAS or a SAR, but rather is provided to assist the Client in the assessment and management of contamination issues at the site. The information provided herein should not be considered pre-emptive of the final Audit conclusions. It represents the Auditor's opinion based on the review of currently available information.

Should you have any queries or wish to discuss any points, please do not hesitate to contact Fiona Wong or the undersigned.

Yours sincerely,

Rebeka Hall
NSW EPA Accredited Site Auditor
Zoic Environmental Pty Ltd

Table 1: Evaluation of JBS&G (8 December 2020) Revised Draft RWP

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 1: Evaluation of JBS&G (8 December 2020) Revised Draft RWP

Requirement	Consultant Consideration	Auditor Comment
Objectives:	Section 1.2 states that the objectives of the remediation were to 'render the site suitable for the proposed use'. JBS&G states that 'this RWP will be revised upon receipt of the additional investigation results proposed to be completed prior to remediation works as outlined in JBS&G (2020)'.	Auditor notes: • Further data gap investigation is proposed to determine the extent of remedial works required for AEC 1 (chlorinated ethene impacted soils) • Further data gap investigation is proposed to determine the extent of remedial works required for AEC3 (transformer footprint) and AEC4 (fill material). A SAQP will be prepared and issued to the Auditor for review and endorsement prior to works commencing. • Delineation of groundwater impact and/or offsite migration is to be conducted during demolition works. A SAQP will be prepared and issued to the Auditor for review and endorsement prior to works commencing. **The RWP will be an evolving document as new information is obtained.**
Scope of work	Section 4 states that the scope includes: • Remediation of fill material underlying buildings, noting that further assessment will be required to determine the nature and extent of the remedial works • Remediation of chlorinated ethene impacted soils • Remediation and/or management of soils underlying transformer	Acceptable, noting further characterisation is required for AECs 1, 3 and 4 as well as addressing groundwater conditions.
Site identification	Section 2.1 provides site identification details.	Acceptable
Site history	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)
Site condition and surrounding environment	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)
Remediation criteria	Soil remediation criteria have not been included as onsite containment is the preferred option. For chlorinated ethene impacted soil, ASLP results will be compared to ANZG (2018) for freshwater ecosystems protective of 95% of species. An attenuation factor of 10 will be applied to the applicable criteria before screening of the validation data given that the containment cell will be placed above the groundwater table and that surface water infiltration will largely eliminated through a GCL membrane or hardstand surface Section 6.1.2 states that 'validation criteria for the excavation extent is to be agreed with the site auditor prior to implementation'.	In JBS&G (8 December 2020) Response to IA3, JBS&G states that 'the site validation criteria will be consistent with Section 8.7 of the RAP (JBS&G 2019) unless a subsequent quantitative risk assessment is completed in order to derive site specific validation criteria subject to Auditor review and endorsement. In addition, the attenuation factor of 10 has been removed for comparison of leachate analysis (in soils proposed to be retained on site) to ANZG (2018) in order to maintain sufficient conservatism within the remedial approach.' In Section 8.7 of the JBS&G (2019) RAP, for chlorinated ethene impact validation works, JBS&G states that 'the specific requirements for this assessment shall be detailed in a the VVSAQP, either included within the stage specific RWPs or to be issued separately, to the Site Auditor subsequent to delineation of soil-vapour impact. The RWPs/VVSAQP will include PID action criteria to guide field screening assessment'.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
Results	Tabulated results and figures have not been included. Section 4 discusses the results, which provide the following: • Fill material underlying buildings (AEC 4) • Chlorinated ethene impacted soils (AEC 1) • Soils underlying transformers (AEC 3)	Results are to be included the final RWP.
Results of remediation pilot trials (if applicable)	Not proposed	Not applicable
Conceptual Site Model	Not provided.	Although not included in the RWP, this is outlined in the overarching RAP (JBSG 2019)
Remediation Option Assessment and Remediation Strategy		
Extent of remediation required as outlined in RAP	Section 4 provides the extent of the area requiring remediation, summarised below: • Based on the current data, the extent of remediation area for chlorinated ethene impacted soil (AEC 1) is approximately '650m2 over an average excavation depth of 1.5m and assuming a contingency factor of +50% for depth and/or lateral variation equates to an approximate volume of 1500m3 in situ'. Figure 3 shows the proposed extent of remediation for AEC 1. It is noted that the extent of remediation and/or management of fill material and soils underlying transformer are to be determined following completed of additional assessment.	Section 4.2 states that the extent of remediation for AEC 1 is not yet defined. The Auditor agrees - remediation may extend further along sewer lines and under buildings that could not be accessed for the most recent round of assessment. The extent of soil underlying transformers (AEC 3) and fill impacted soils (AEC 4) are unknown and further investigation is proposed by JBSG (as stated in Sec 4.1)
Discussion of possible remediation options	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Selected remediation option	Section 5 states that onsite containment is the preferred remediation option. Materials deemed to be unsuitable to retain onsite will be removed for offsite disposal.	Considered acceptable, pending additional delineation findings to confirm extent of impact, and confirmation of contaminant behaviour if capped. Any material that is contained and capped on site must not leach to protect the underlying groundwater.
Rationale for selected remedial option	Not provided.	Covered in JBS&G (2019) Overarching RAP. Any capping will require a long term Environmental Management Plan (LTEMP). Groundwater quality requires further assessment. Depending on those findings the RWP may need revision.
Description of remediation works:	Section 5 provides description of the remediation works for: • Chlorinated ethene impacted soils (AEC 1) - Complete the remainder of pre-remediation investigation to determine the extent of remediation area	Considered acceptable, noting that further investigation will be conducted to confirm the extent of the remediation works required at the site.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
	- Excavate underground utilities, followed by impacted soil. - Materials are to be stored in 70m3 stockpiles for further testing to determine suitability for onsite retention. Unsuitable material will be disposed offsite. - Materials to be retained will be consolidated into a single stockpile prior to final placement within an onsite containment cell. The cell will be at least 30m away from current and future structures and located above the groundwater table. - The cell will be located under future hardstand or placed under a geosynthetic clay liner with a hydraulic conductivity of less than $5x10^{-11}$m/s. A marker layer will be placed prior to the placement of a capping layer of at least 1m thick. A marker layer will be placed between the GCL and capping layer. • Soils underlying transformers (AEC 3) will be tested to determine the extent of remediation area (if required). • Fill impacted soil (AEC 4): - The preferred remediation approach will be determined following the completion of additional works. At this stage, a cap and contain is the preferred option. Impacted soil is to be placed beneath a capping layer, with cap thickness of at least 1m. A marker layer will be installed prior to placement of the capping layer. • In JBS&G (8 December 2020) Response to IA3, JBS&G states that 'delineation of groundwater impact and/or offsite migration is to be conducted during demolition works. A SAQP will be prepared and issued to the Auditor for review' and endorsement prior to works commencing.	
Validation plan	Section 6 provides validation testing requirement, which includes: • Impacted fill material – to be determined following completion of additional testing. • Chlorinated ethene impacted soils – validation of excavations - Boreholes will be advanced to facilitate soil vapour probe installation. Probes will be installed to a depth of 1m within the walls or base of excavation. - Soil vapour probes will be left to equilibrate for period of 24 hours prior to sampling. - Probes will be purged using a multi-gas meter for at least 30s. - Leak detection evaluation via placement of an isopropyl alcohol-soaked rag	The Auditor has reviewed this section and notes the following: • Final extent of excavation will be informed by a combination of soil and soil vapour sampling. JBS&G states that works are to be conducted as per Section 8.2.6.1 in the JBS&G (2019) however, the following discrepancies were noted: - The installation of temporary soil vapour probes were proposed at a rate of 1 per 5m excavation wall, with a min of 1 per wall; and at a rate of 1 per 25m2 base, with a minimum of 4 per excavation. This has not been included in the JBS&G (2020) Revised RWP. The Auditor requires the final validation sampling densities to be confirmed in the final Remedial Works Plan, following completion of the pre-remediation investigations to close out the current data gaps in delineation.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
	- Sampling will be conducted using a carbon tube via a telfon tubing. - Final sampling density will be based on a 10m grid for soil vapour. - In addition, soil samples will also be collected from the wall and base of excavation at a frequency of 1 sample per 5 linear metre per wall and 1 per 25m2 for base sample. - Soil vapour samples will be analysed for TRHs and VOCs. If chlorinated ethenes are present, ASLP will also be tested. • Chlorinated ethene impacted soils – validation of suitability for onsite containment - Samples will be collected at a frequency of 70m3 and tested for ASLP. - CE impacted soils containment cell will be at least 30m away from current/future structures. • Validation of soil containment - A location plan of the placed materials with co-ordinates based on an agreed grid system (e.g., GPS or relative to the lot boundaries) - The levels in m AHD of the base of the placement location(s) prior to the material placement - The levels in m AHD of the placement locations once all materials have been placed - Daily inspections by the environmental consultant to record when and where the GCL and marker layer has been installed - The levels in m AHD of the finished barrier layer surface - Subsequently the total placed volume of materials - Site surveys are to be prepared by a registered surveyor.	
Contingency plan if selected remedial strategy fails	Not provided.	No contingency presented for groundwater. This should be updated following completion of pre-remediation investigation and groundwater assessment works
Unexpected finds protocol:	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Interim site management plan before remediation	In JBS&G (8 December 2020) Response to IA3, JBS&G states that 'all interim environmental monitoring within Shop 3 was completed at the required frequency. No unacceptable health risks were identified to occupants of the building. It is noted that the shop was recently vacated and that the monitoring has now ceased'.	Noted.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Requirement	Consultant Consideration	Auditor Comment
Site management plan for remediation works	Not provided	Covered in JBS&G (2019) Overarching RAP.
Regulatory compliance requirements	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Contact persons	Not provided.	Covered in JBS&G (2019) Overarching RAP but to be updated as the RWP evolves and contractors are appointed.
Community relations (where applicable)	Not provided.	Covered in JBS&G (2019) Overarching RAP.
Staged progress reporting (where applicable)	Not provided	It is understood staged progress reporting is not required.
Environmental management plan requirement	Section 6.3 provides details of requirement of ongoing environmental management plan requirements. Furthermore, in JBS&G (8 December 2020) Response to IA3, JBS&G states that 'it is anticipated that the LTEMP will be included on the Council 10.7 planning certificates and be made legally enforceable by appropriate notification to the regulatory authority (Council). Council as the landowner will be responsible for appropriately implementing the LTEMP. It is anticipated that the LTEMP will be included on the Council 10.7 planning certificates and be made legally enforceable by appropriate notification to the regulatory authority (Council). Council as the landowner will be responsible for appropriately implementing the LTEMP'.	Any LTEMP must be publicly notified (e.g. Sec 10.7 certificate) and legally enforceable. Stating that the LTEMP will be 'made legally enforceable by appropriate notification to the regulatory authority (Council)' **is not a legal** mechanism. A condition in the DA consent for the requirement of a LTEMP to manage residual is a mechanism for legal enforcement.
Waste Management		
Waste classification:	Section 5.4 states that waste classification is to be conducted in accordance with NSW EPA (2014) Waste Classification Guidelines.	Acceptable
Material handling and tracking plan:	Not provided.	Covered in JBS&G (2019) Overarching RAP.

GLOSSARY

NOISE

Noise is produced through rapid variations in air pressure at audible frequencies (20 Hz – 20 kHz). Most noise sources vary with time. The measurement of a variable noise source requires the ability to describe the sound over a particular duration of time. A series of industry standard statistical descriptors have been developed to describe variable noise, as outlined in Section 2 below.

NOISE DESCRIPTORS

L_{eq} – The sound pressure level averaged over the measurement period. It can be considered as the equivalent continuous steady-state sound pressure level, which would have the same total acoustic energy as the real fluctuating noise over the same time period.

$L_{Aeq(15\ min)}$ – The A-weighted equivalent continuous sound level over a 15 minute period.

L_{A90} – The A-weighted noise level that has been exceeded for 90% of the measurement duration.

dB – Decibels. The fundamental unit of sound, a Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell. Probably the most common usage of the Decibel in reference to sound loudness is dB sound pressure level (SPL), referenced to the nominal threshold of human hearing. For sound in air and other gases, dB(SPL) is relative to 20 micropascals (μPa) = 2×10^{-5} Pa, the quietest sound a human can hear.

A-WEIGHTING

"A-weighting" refers to a prescribed amplitude versus frequency curve used to "weight" noise measurements in order to represent the frequency response of the human ear. Simply, the human ear is less sensitive to noise at some frequencies and more sensitive to noise at other frequencies. The A-weighting is a method to present a measurement or calculation result with a number representing how humans subjectively hear different frequencies at different levels.

1 INTRODUCTION

1.1 SUMMARY

Acoustic Dynamics is engaged by **JBS&G** on behalf of Penrith City Council to assess and, where required, make recommendations to reduce and manage the noise and vibration impact at the nearest potentially affected receivers resulting from the demolition, excavation and construction works, and associated activities, for the proposed parkland development located at the corner of Henry Street and Station Street, Penrith, NSW, in accordance with the requirements of Penrith City Council.

The proposal is for the demolition of the existing structures from 134 to 144 Henry Street, and 44 to 50 Station Street, and the construction of a city park.

This report presents the relevant construction noise and vibration emission objectives, construction noise and vibration prediction calculations, an impact assessment and recommendations for mitigation and management measures to be implemented, to minimise the potential for adverse impact at the nearest potentially affected receivers, resulting from excavation and construction works.

This report is prepared in accordance with the requirements and guidelines of Penrith City Council, the NSW Environment Protection Authority (EPA), and relevant Australian Standards.

1.2 LOCATION OF PROPOSED DEVELOPMENT

The proposed development is to be located at the corner of Henry Street and Station Street, Penrith, NSW. The proposed development is a public park for the greater community.

All boundaries of the site are shared with streets, with Henry Street to the north, Station Street to the West, Allen Place and the Allen Place carpark to the south, and Gaymark Lane to the East. The nearest receivers are commercial developments, with the nearest residence 160 metres to the south west of the subject site.

The surrounding commercial receivers located along Station Street, Henry Street, Gaymark Lane and Allen Place are deemed to be the nearest potentially affected receiver locations.

The proposed development is shown in the Location Map & Drawings presented within **Appendix A**.

Based on information provided by the proponent, Acoustic Dynamics advises that demolition works would approximately occur for 1 month, excavation works would occur for 3 months, and construction works to occur for 3 months, during the daytime hours only.

Acoustic Dynamics is advised that use of noise generating equipment during the proposed works will be undertaken between the following operating hours, as shown in **Table 1.1**.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 1.1 Operating Hours of Noise Generating Equipment

Activity	Permitted Work Hours
All building, construction and site work, including site deliveries (except as detailed below)	• Monday to Friday – 7:00am to 5:00pm • Saturday – 8:00 am to 1:00 pm • Sunday & public holidays – No work permitted
Excavating of rock, use of jack-hammers, pile-drivers or the like	• Monday to Friday – 7:00am to 5:00pm • Saturday – 8:00 am to 1:00 pm • Sunday & public holidays – No work permitted

2 ASSESSMENT CRITERIA AND STANDARDS

2.1 ASSESSMENT CRITERIA

The following sections outline the relevant construction noise emission criteria and conditions applicable to the works.

2.2 PENRTIH CITY COUNCIL CRITERIA

2.2.1 LOCAL ENVIRONMENTAL PLAN & DEVELOPMENT CONTROL PLAN

Acoustic Dynamics has conducted a review of the following documents:

- Penrith Development Control Plan (DCP) 2014; and
- Penrith Local Environmental Plan (LEP) 2010.

A review of the DCP and LEP documents found no specific criteria relating to the management and mitigation of noise during excavation or construction.

2.2.2 COUNCIL REQUESTS

Acoustic Dynamics understands Penrith City Council made the following request prior to submission of the Stage 1 application in relation to noise and vibration emission during construction:

"Noise Impacts
Given the scale of the demolition works proposed, and the potential for significant excavation as part of the remediation works, an acoustic assessment is to be submitted as part of the Stage 1 application to demonstrate that the proposed development will not have any impact on nearby sensitive receivers. This report is to be prepared by an appropriately qualified acoustic consultant and is to consider the Interim Construction Noise Guideline in assessing the noise and vibration impacts associated with the demolition and remediation works

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

proposed. Should mitigation measures be necessary, recommendations should be included to this effect."

2.3 AUSTRALIAN STANDARDS

Acoustic Dynamics has conducted a review of relevant Australian Standards in relation to the subject development. The following details this review.

2.3.1 AS2436 *"GUIDE TO NOISE CONTROL ON CONSTRUCTION ... SITES"*

Australian Standard 2436-2010: *"Guide to Noise and Vibration Control on Construction, Demolition and Maintenance Sites"* provides guidance on noise control in respect of engineering construction, maintenance and demolition works, including guidance in investigation and identification of noise sources, measurement of sound, and it's assessment, with a view to planning of measures for noise control.

Acoustic Dynamics advises that AS 2436 contains the following information relating to appropriate noise emission goals for construction sites:

> ***"3.2 NOISE AND VIBRATION IMPACTS ON THE COMMUNITY***
>
> *Whether or not noise from a construction, maintenance or demolition site is likely to constitute a problem depends upon a number of considerations, such as –*
>
> *(a) existing background noise level;*
> *(b) distance between the site and the areas likely to be affected by the construction noise;*
> *(c) nature of buildings and the activity therein, where the noise is likely to be heard;*
> *(d) the likely duration of construction, maintenance and demolition operations and the hours during which the above operations will be carried out (whether during the day, night or weekends);*
> *(e) the nature of the noise, e.g. audible pure tone components and impulsive character; and*
> *(f) the number of items of major plant and equipment being utilized simultaneously on the site for their cumulative impact.*
>
> *Some construction or demolition activities are by their very nature noisy. The authorities responsible for setting noise level criteria for essential works will take note of the constraints imposed by such activities, especially when they are of short duration."*

Acoustic Dynamics advises that determination of appropriate noise emission goals for the proposed works in accordance with the EPA's guidelines will satisfy the recommendations and guidelines detailed within AS 2436.

We advise that assessment of the proposed works, detailed within this document, has been carried out in accordance with the information and guidelines detailed within AS 2436.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2.4 NSW EPA INTERIM CONSTRUCTION NOISE GUIDELINE

In this section, the relevant construction noise emission criteria and conditions applicable to the works are outlined, based on the NSW Environment Protection Authority's (EPA's) *Interim Construction Noise Guideline* (ICNG).

The NSW EPA's ICNG is developed to manage noise from construction works. The ICNG advises that a quantitative methodology of assessment of construction noise emission may be undertaken for long-term (greater than three weeks) works.

Acoustic Dynamics advises that the most appropriate methodology for the assessment of noise emission from the proposed works is a quantitative assessment, to ensure noise emission from the works is minimised. Note should be made that the ICNG states that when developing noise mitigation strategies for reducing construction noise emission focus should be given to *"applying all 'feasible' and 'reasonable' work practices to minimise construction noise impacts"*.

Accordingly, relevant noise emission goals have been determined for the proposed works, in accordance with the information contained within the ICNG, which should be achieved where possible.

The ICNG provides information on management levels (noise emission goals) for construction noise emission at residential receivers, and other various sensitive receivers. The management noise levels at residential receivers are dependent upon the relevant rated background level (RBL) at the residential receiver, and the time of day that the construction noise is to be generated.

Acoustic Dynamics has determined the daytime background noise environment at the nearest residential receivers, as referred to in the EPA's ICNG. The results of operator-attended noise measurements in the area on Monday 30 November 2020 are presented in **Table 2.1**.

Table 2.1 Measured Ambient Noise Environment

Location	Period	Measured Noise Levels [dB][1]	
		RBL (L_{A90})	L_{Aeq}
Nearest Receivers (Allen Place)	Daytime	51	61
Nearest Receivers (Henry Street)		60	67

Note: 1) Measured noise levels are ambient, and do not include any subject works or associated activities.
2) Works at the site will not take place outside daytime hours of 7am to 5pm Monday to Saturday.

Based on the measured background noise environment, **Table 2.2** presents the construction noise emission management levels/objectives, as detailed in the EPA's ICNG, for the nearest receivers:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 2.2 Site Specific Construction Noise Objectives at Residential Receivers

Time of Day	EPA Management Level ($L_{Aeq\ (15\ min)}$)	Site specific construction noise emission goals $L_{Aeq\ (15\ min)}$ [dB]
Recommended Standard Hours: Monday to Friday 7am to 4pm Saturday 8am to 3pm No work on Sundays or Public Holidays	Offices, Retail Outlets	**70**

Note: 1) Works at the site are not expected to take place outside recommended standard hours.

Based on the information contained within the EPA's ICNG, Acoustic Dynamics recommends that noise emission from the proposed works achieves the following noise emission goals, when possible.

Note should be made that as night-time works are not expected to occur, the assessment of sleep disturbance is not warranted.

2.5 CONSTRUCTION VIBRATION CRITERIA

Structural and cosmetic damage vibration criteria are guided by the vibration levels presented within the standards BS 7385 and DIN 4150 and the NSW EPA document *"Assessing Vibration - a technical guide"*.

In terms of the most recent relevant vibration damage criteria, British Standard 7385: Part 2-1993 "Evaluation and measurement for vibration in buildings Part 2 - Guide to damage levels from ground-borne vibration" *represents a definitive standard against which the likelihood of building damage from ground vibration can been assessed.*

Although there is a lack of reliable data on the threshold of vibration-induced damage in buildings both in countries where national standards already exist and in the UK, BS 7385: Part 2 has been developed from an extensive review of UK data, relevant national and international documents and other published data.

The standard sets guide values for building vibration based on the lowest vibration levels above which damage has been credibly demonstrated. These levels are judged to give a minimum risk of vibration-induced damage, where minimal risk for a named effect is usually taken as a 95% probability of no effect.

Sources of vibration, which are considered in the standard, include blasting (carried out during mineral extraction or construction excavation), excavation, piling (sheet, bored, contiguous), ground treatments (e.g. compaction), construction equipment, tunnelling, road and rail traffic and industrial machinery.

The guide values from this standard for transient vibration judged to result in a minimal risk of cosmetic damage to residential buildings and industrial buildings are presented numerically in **Table 2.3** and graphically in **Figure 2.4**.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

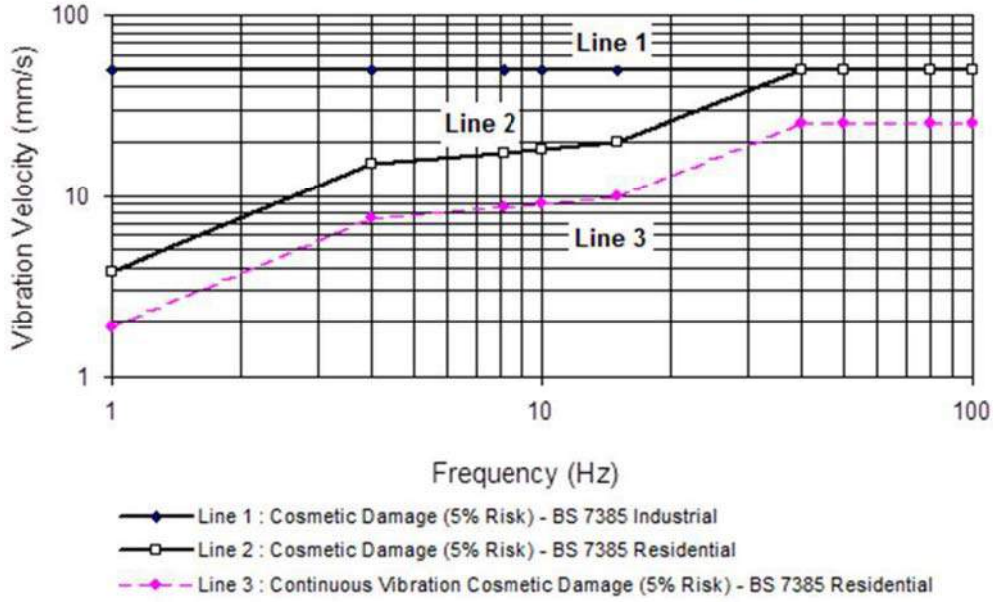
Table 2.3 Transient Vibration Guide Values - Minimal Risk of Cosmetic Damage

Line	Type of Building	Peak Component Particle Velocity in Frequency Range of Predominant Pulse	
		4 Hz to 15 Hz	15 Hz and above
1	Reinforced or framed structures Industrial and heavy commercial buildings	50 mm/s at 4 Hz and above	
2	Unreinforced or light framed structures residential or light commercial type buildings	15 mm/s at 4 Hz increasing to 20 mm/s at 15 Hz	20 mm/s at 15 Hz increasing to 50 mm/s at 40 Hz and above

In relation to guide values for continuous vibration relating to cosmetic damage, the standard states that the guide values in **Table 2.5** relate predominantly to transient vibration, which does not give rise the resonant responses in structures, and to low-rise buildings.

Where the dynamic loading caused by continuous vibration is such as to give rise to dynamic magnification due to resonance, especially at lower frequencies where lower guide values apply, then the guide values in **Table 2.5** may need to be reduced by up to 50%, as is the case with continuous vibration from rock breaking.

Figure 2.4 Graph of Transient Vibration Guide Values for Cosmetic Damage



The standard goes on to state that minor damage is possible at vibration magnitudes, which are greater than twice those given in **Table 2.3**, and major damage to a building structure may occur at values greater than four times the tabulated values.

It is noteworthy that in addition to the guideline values presented in **Table 2.3**, the standard also states the following:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

"Some data suggests that the probability of damage tends towards zero at 12.5 mm/s peak component particle velocity. This is not inconsistent with an extensive review of the case history information available in the UK."

Note is made that **cosmetic damage** to buildings occurs at vibration levels significantly lower than those causing **structural damage**.

- British Standard 7385 indicates a 5% risk of **cosmetic damage** to commercial/industrial buildings at 50 mm/s from transient vibration and at 25 mm/s from continuous vibration; and

- British Standard 7385 indicates a 5% risk of **cosmetic damage** to residential and light framed structures at 15 mm/s at 4 Hz from transient vibration and at 7.5 mm/s at 4 Hz from continuous vibration.

In addition to the above standard, the German Standard DIN 4150 provides guideline values of vibration velocity for evaluating the effects of short-term vibration. Table 1 of DIN 4150 is reproduced as **Table 2.5** below.

Table 2.5 Guideline values of vibration velocity, vi, for evaluating the effects of short-term vibration

Line	Type of structure	Vibration Velocity, v_i, in mm/s			
		Foundation			Plane of floor of uppermost full storey
		At a frequency of			Frequency mixture
		Less than 10 Hz	10 to 50 Hz	50 to 100)* Hz	
1	Buildings used for commercial purposes, industrial buildings and buildings of similar design	20	20 to 40	40 to 50	40
2	Dwellings and buildings of similar design and/or use	5	5 to 15	15 to 20	15
3	Structures that, because of their particular sensitivity to vibration, do not correspond to those listed in lines 1 and 2 and are of great intrinsic value (e.g. buildings that are under a preservation order)	3	3 to 8	8 to 10	8
*) For frequencies above 100 Hz, at least the values specified in this column should be applied.					

In view of the foregoing, the following **conservative** site assessment control limits could be adopted for the purposes of monitoring and evaluating the measured vibration levels from the excavation works, should this be required:

Residential Structures Adjacent to Proposed Works:

- All buildings and structures adjacent to works – 7.5 mm/s peak component particle velocity (site control level).

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3 PROCEDURES AND IMPLEMENTATION

3.1 INSTRUMENTATION & MEASUREMENT STANDARDS

All measurements were conducted in general accordance with Australian Standard 1055.1-1997, *"Acoustics - Description and Measurement of Environmental Noise Part 1: General Procedures"*. Acoustic Dynamics' sound measurements were carried out using precision sound level meters conforming to the requirements of IEC 61672-2019 *"Electroacoustics: Sound Level Meters – Part 1: Specifications"*. The survey instrumentation used during the survey is set out in **Table 3.1**.

Table 3.1 Noise Survey Instrumentation

Type	Serial Number	Instrument Description
2250	2679541	Brüel & Kjaer Modular Precision Sound Level Meter
4189	2670479	Brüel & Kjaer 12.5 mm Prepolarised Condenser Microphone
4230	1234136	Brüel & Kjaer Acoustic Calibrator

The reference sound pressure level was checked prior to and after the measurements using the acoustic calibrator and remained within acceptable limits.

The prevailing weather conditions during the measurements were generally calm and did not influence the noise measurements taken.

4 METHODOLOGY FOR EMISSION PREDICTITION AND ASSESSMENT

Acoustic Dynamics understands that the following items of noise emitting equipment and machinery are likely to be used during the excavation and construction works on site:

Demolition and Excavation (Around 5 weeks duration)

- Hammers;
- Saws;
- Grinders;
- Other hand-held tools;
- 5 Tonne Excavator, (including attachments);
- 14.5 Tonne Excavator, (including attachments); and
- Trucks (for removal of materials).

Construction (Around 40 weeks duration)

- Hammers;
- Saws;
- Grinders;
- Drills;
- Mud/cement mixers;

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Kanga hammers
- Nail guns;
- Compressors;
- Mobile cranes;
- Concrete trucks/pumps;
- Vehicle movements, including:
  - Trucks (for delivery of materials);
  - Trades; and
- Other typical building tools/equipment.

Accordingly, assessment of the operation of above items requires calculation of their noise emission levels to nearby potentially affected receiver locations.

Acoustic Dynamics has conducted operator-attended noise monitoring of similar/equivalent equipment at various other sites on numerous occasions. Based on previous operator-attended surveys of similar activities and equipment, prediction calculations have been undertaken to predict the noise impact at adjacent receiver locations, resulting from the proposed works, in accordance with the information and guidelines detailed in AS 2436 and the relevant EPA documents.

In our noise prediction calculations and modelling, the noise emission contribution from the above items of equipment has been incorporated into the prediction calculations and modelling along with various loss factors, including:

- Losses due to distance and ground topography;
- Airborne noise losses;
- Losses due to direction;
- Acoustic shielding.

5 NOISE & VIBRATION EMISSION PREDICTION AND ASSESSMENT

In this section Acoustic Dynamics provides an assessment of noise emission from proposed excavation and construction works at the subject site.

Acoustic Dynamics advises that the project is likely to be undertaken in two main stages:

- Demolition and Excavation; and
- Construction.

Acoustic Dynamics understands that demolition and excavation works would be undertaken over a period of 5 weeks. Construction works would then be undertaken and may last for a period of around 40 weeks.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5.1 NOISE EMISSION PREDICTION CALCULATIONS AND MODELLING

Acoustic Dynamics has performed prediction calculations and determined maximum L_{Aeq} noise emission levels at adjacent receiver locations, resulting from proposed excavation and construction activities, including use of the tools and equipment listed in **section 5**.

For the purpose of noise assessment, the likely maximum *"at source"* noise levels (A-weighted sound pressure levels at 1 metre) have been used as detailed below.

Demolition

- Hammers – 85 dB;
- Saws – 101 dB;
- Grinders – 80 dB
- Hand-held and electric tools – 94 dB;
- 5 Tonne excavator – 90 dB;
- 28 Tonne Excavator – 93dB; and
- Trucks (for removal of materials) – 90 dB.

Excavation

- 5 Tonne excavator – 90 dB;
- 28 Tonne Excavator – 93dB; and
- Trucks (for removal of materials) – 90 dB.

Construction

- Hammers – 85 dB;
- Saws – 101 dB;
- Grinders – 80 dB;
- Drills – 80 dB;
- Mud/cement mixers – 100 dB;
- Nail guns – 85 dB;
- Compressors – 92 dB;
- Kanga hammers – 103 dB;
- Concrete trucks/pumps – 95 dB;
- Vehicle movements including:
- Trucks (for delivery of materials) – 90 dB;
- Trades – N/A; and
- Other hand-held and electric tools – 94 dB.

The results from Acoustic Dynamics' noise prediction calculations and modelling are presented in **Table 5.1** below, and represent calculated **maximum** received noise emission levels resulting from the use/operation of the highest noise emitting items listed above.

Note should be made that the highest noise emitting items of plant and equipment are unlikely to be used for long durations.

Note should be made that the predicted noise levels presented in **Table 5.1** below, are the **maximum** predicted L_{Aeq} noise levels at the nearest boundaries of the listed properties,

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

resulting from proposed excavation and construction works at the subject site. Typically, received L_{Aeq} noise emission levels would be expected to be lower than these during the majority of the excavation and construction works. Significantly lower noise levels than those presented in the table would also be expected within (inside) the nearby dwellings.

Table 5.1 Maximum Excavation and Construction Works Noise Emission and Criteria

Receiver Location	Stage of Works	Predicted Range of L_{Aeq} Noise Levels[1] [dB]	EPA L_{Aeq} Noise Management Levels [dB]		Achieves EPA Guidelines?	
			Noise Affected	Highly Noise Affected	Noise Affected	Highly Noise Affected
Receivers across Henry Street (North)	Demolition	50 - 60	70	75	**Yes**	**Yes**
	Excavation	50 – 62			**Yes**	**Yes**
	Construction	61 – 66			**Yes**	**Yes**
Receivers across Gaymark Lane (East)	Demolition	46 – 64	70	75	**Yes**	**Yes**
	Excavation	47 – 47			**Yes**	**Yes**
	Construction	57 – 69			**Yes**	**Yes**
Receivers across Allen Lane (South)	Demolition	49 – 59	70	75	**Yes**	**Yes**
	Excavation	49 – 58			**Yes**	**Yes**
	Construction	60 – 63			**Yes**	**Yes**
Receivers across Station Street (West)	Demolition	45 – 62	70	75	**Yes**	**Yes**
	Excavation	45 – 62			**Yes**	**Yes**
	Construction	56 - 73			**No**	**Yes**

Note: 1) Calculated noise level at nearest residential boundary or nearest exposed facade.

2) Instances considered "highly noise affected" will be infrequent, and are unlikely to unreasonably disturb the adjoining properties.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

5.2 NOISE EMISSION ASSESSMENT

The predicted noise emission levels presented in **Table 5.1** above indicate L_{Aeq} noise emission associated with the proposed construction works will exceed the relevant 'Noise Affected' construction noise management level of $L_{Aeq(15minute)}$ 45 dB at the nearest affected commercial receivers to the west of the site. Compliance is expected to be achieved with the relevant 'Noise Affected" construction noise management level of $L_{Aeq(15minute)}$ 45 dB at all nearest receivers at all other times.

At all neighbouring premises, the predicted L_{Aeq} noise emission associated with the proposed construction works is expected to comply with the relevant 'Highly Noise Affected' construction noise management level of $L_{Aeq(15minute)}$ 75 dB.

Although not considered acoustically significant because of the short duration and nature of construction activities, the magnitude of the predicted exceedance may lead to complaint and appropriate strategies should be developed for management of noise emission and community liaison.

To ensure that construction noise emission levels from the proposed works are kept to a minimum, Acoustic Dynamics provides recommendations for feasible and reasonable noise mitigation and management, which should be incorporated into the noise management plan for the proposed excavation and construction works.

5.3 VIBRATION EMISSION PREDICTION CALCULATIONS AND MODELLING

Acoustic Dynamics has been advised that mechanical excavation methods will be utilised, and based on this information advises that this excavation methodology is likely to result in minimal perceivable vibration levels (human comfort) at nearby/adjacent residential dwellings.

Acoustic Dynamics advises that where rock is to be removed from the site, excavation should incorporate the use of saw cuts in rock to enable smaller, rather than large, rock-breakers to be used to break the rock away from the saw cut.

Such sawing has been shown to produce significantly lower vibration levels and substantially reduce the potential for structural (or even cosmetic) damage to adjacent buildings and structures.

Acoustic Dynamics has predicted likely vibration levels at the nearest potentially affected adjacent receiver locations. Acoustic Dynamics' prediction calculation results are presented in **Table 5.2** below.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 5.2 Predicted Excavation Works Vibration Emission Levels and Criteria

Location	Receiver Location	Predicted Vibration Levels (PPV)[1]	5% Risk of Cosmetic Damage Criterion	Likely to Comply?
Across Henry Street	Commercial receivers to the North	**<2 mm/s**	7.5 mm	**Yes**
Across Gaymark Lane	Commercial receivers to the East	**<2 mm/s**		**Yes**
Across Allen Place	Commercial receivers to the South	**<2 mm/s**		**Yes**
Across Station Street	Commercial receivers to the West	**<2 mm/s**		**Yes**

Note: 1) Predicted received peak component particle velocity (PPV) at structure.

Acoustic Dynamics advises that predicted vibration emission levels, resulting from the proposed works are well below structural damage criteria presented within **Section 3.5** of this report.

6 DISCUSSION AND RECOMMENDATIONS

Further to the predicted noise emission levels presented in **Section 5**, Acoustic Dynamics advises that measures are required to minimise and manage noise emission and impact from the proposed excavation and construction works at the subject site.

Acoustic Dynamics recommends that the use of noise generating equipment during the proposed works at the subject site only be carried out during the following construction hours:

- Monday to Friday 7:00am to 5:00pm; and
- Saturday 8:00am to 1:00pm.

Acoustic Dynamics recommends the following measures be implemented to minimise and manage noise and vibration emission from the subject excavation and construction:

1. Noise & vibration induction of all site staff – including the explanation of noise and vibration control and minimisation and a discussion of project specific reduction strategies;

2. Implementation of an appropriate community liaison procedure – including a noise and vibration management and noise and vibration complaint procedure and continual liaison with nearby potentially affected receivers;

3. Implementation of a noise and vibration monitoring and reporting programme (where necessary – to protect the interest of all parties or should complaints arise);

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

4. The use of temporary noise barriers around particularly noisy activities (where feasible and reasonable);

5. Use of quietest available equipment and lowest vibration generating equipment for works (where feasible and reasonable);

6. Where excavation of rock is required, an appropriate excavation methodology should be adopted:

    - Use of saw cuts in rock around the external perimeter of any excavation works, and wherever feasible, to enable smaller rock-breaker to be used to remove the remaining rock;
    - Use of hand held jackhammers for rock-breaking activities within 5m of adjacent structures;
        i. No use of small rock-breakers within 5m of adjacent structures;
        ii. No use of large rock-breakers within 10m of adjacent structures;
    - Vibration monitoring during periods of intensive excavation works, where adverse comment is generated or possible;

7. Where there is any risk of damage, a dilapidation survey of adjacent buildings and structures should be completed prior to the commencement of any excavation works;

8. Implementation of periods of respite, where highly intensive activities produce loud noise (i.e. greater than 75 dB(A) at nearby residences) to minimise disturbance on nearby receivers; and

9. Should trucks or other vehicles be required to be on site for longer than five minutes, Acoustic Dynamics advises that engines should be switched off for the duration.

The following sections provide detail about the various measures listed above and how they are to be incorporated into the noise management procedures for the proposed works.

6.1 NOISE AND VIBRATION INDUCTION OF ALL SITE STAFF

Acoustic Dynamics recommends all site staff be inducted, ensuring each person is aware of the noise and vibration management and mitigation procedures applicable to the site and subject site works.

6.2 IMPLEMENTATION OF COMMUNITY LIASON PROCEDURE

Acoustic Dynamics recommends implementation of an appropriate community liaison procedure, including a noise management and compliant procedure, and continual liaison with the nearby potentially affected receivers. The following should be carried out by the proponent:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- A sign is to be located near the entry to the site with 24 hour contact details (mobile phone numbers and email addresses for receipt of complaints);
- A detailed (physical) log of all complaints relating to noise is to be kept on site. Such a log should including details of:
  i. the address of the complainant;
  ii. the date and time of the complaint;
  iii. the date and time the subject noise was heard;
  iv. a description of the activities being undertaken at the time of the subject complain;
  v. a contact telephone number for the complainant; and
  vi. detail of the person who fielded and logged the complaint;
  vii. the signature of the project manager or site foreman confirming the complaint has reached an appropriate level of responsibility;
  viii. detail of the action taken to respond to the complaint and the timing of this response; and
  ix. the signature of the project manager or site foreman signing off confirmation that the complaint has been appropriately addressed.

NB: Note is made that should the complaint require the services of an independent consultant to investigate or conduct measurements, such services shall be engaged promptly and dates and times of contact with such a consultant shall be maintained/detailed within the complaints log.

6.3 USE OF TEMPORARY NOISE BARRIERS

Where feasible and reasonable, Acoustic Dynamics recommends the use of temporary noise barriers around (or along) the boundaries of the site to assist with reducing noise emission during high noise generating activities to the pedestrian paths surrounding the site. A suitable, temporary noise barrier is likely to:

- Contain **no gaps** along the surface area of the screen, and be **close fitting (ie within 30mm) to the ground** (to prevent the transmission of noise below the barrier); and

- The temporary noise barrier(s) should provide a minimum surface density of **14 kg/m^2**, and contain **no gaps** along the surface of the barrier(s).
  i. 25mm thick marine plywood; or
  ii. A minimum 9mm thick compressed fibros-cement sheeting; or
  iii. Other suitable material (minimum surface density of **14 kg/m^2**); and

- Design of supports of any temporary noise barrier(s) must be verified by a suitably qualified person to ensure sufficient structural and wind loading support is provided.

6.4 USE OF QUIETEST AVAILABLE EQUIPMENT FOR WORKS

Acoustic Dynamics recommends that plant and equipment used during the proposed works be selected to ensure that the quietest available equipment will be used.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

As indicated within **Section 6.3**, Acoustic Dynamics will carry out operator-attended noise measurements of site equipment and operations (as required/requested), to ensure quietest techniques and equipment are being used for the subject works.

6.5 IMPLEMENTATION OF A NOISE & VIBRATION MONITORING AND REPORTING PROGRAMME

Noise & Vibration monitoring during works will need to be incorporated, where appropriate, to monitor and quantify received noise and vibration levels at adjacent buildings and structures.

An appropriate noise and vibration monitoring methodology incorporating operator-attended and/or unattended monitoring could be determined following operator-attended test measurements during initial works.

6.6 AN APPROPRIATE EXCAVATION METHODOLOGY

Where excavation of rock is required, the excavation methodology should incorporate the use of saw cuts in the rock wherever feasible to enable smaller rock-breakers to be used to remove the rock. Such sawing has been shown to produce significantly lower vibration levels and substantially reduce the potential for structural (or even cosmetic) damage to adjacent buildings and structures.

In addition, Acoustic Dynamics recommends the following:

- Use of hand-held jackhammers for rock-breaking activities **within 5m** of adjacent structures;
- No use of small rock-breakers **within 5m** of adjacent structures; and
- No use of large rock-breakers **within 10m** of adjacent structures.

6.7 PREPARATION OF A DILAPIDATION SURVEY OF ADJACENT BUILDINGS AND STRUCTURES

Where there is any risk of damage, a detailed dilapidation survey of adjacent buildings and structures completed prior to the commencement of any excavation works would provide an appropriate reference condition, against which post works inspections can be compared.

6.8 PROVISION OF RESPITE PERIODS DURING INTENSIVE ACTIVITIES

Where there is potential for receivers to be affected by sustained high noise levels (i.e. greater than $L_{Aeq(15minute)}$ 75 dB at nearby residences), periods of respite are to be provided. Such respite may include provisions:

1. Not to commence such noisy activities prior to 8:00am;
2. Not to undertake such noisy activities after 5:00pm; and
3. Not to undertake such noisy activities for any sustained period greater than 3 hours without a minimum 30 minute period of respite.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7 CONCLUSION

Acoustic Dynamics has undertaken a quantitative assessment of the noise impact at the nearest potentially affected receivers resulting from the demolition, excavation and construction works and associated activities, for the proposed works at the southeast corner of Henry Street and Station Street, Penrith, in accordance with the requirements of Penrith City Council, the NSW EPA's guidelines and relevant Australian Standards.

The magnitude of the predicted noise exceedances above the construction noise goals (determined in accordance with the EPA's ICNG) may lead to complaint (adverse comment) and appropriate strategies should be developed for management of noise emission and community liaison.

Acoustic Dynamics advises that implementation of the recommendations contained in **Section 6** of this report will assist with the mitigation and management of noise emission from excavation and construction activities at the subject development site.

Should further information be required relating to this report please contact Acoustic Dynamics on 02 9908 1270.

EXECUTIVE SUMMARY

Penrith City Council (Council) has proposed to establish a City Park at the corner of Station Street and Henry Street, Penrith (the proposal).

In July 2020, Artefact Heritage prepared a preliminary heritage assessment report outlining Aboriginal and non-Aboriginal archaeological potential and identifying the built heritage and heritage-listed items of the study area. The report also included brief identification of heritage constraints and opportunities as relevant to the project.

Artefact Heritage has been engaged by JMD Design on behalf of Council to provide a Heritage Impact Statement (HIS) for the proposal addressing non-Aboriginal heritage values within the study area. The aim of this HIS is to identify listed and non-listed heritage items and archaeological remains which may be impacted by the proposal; determine the level of heritage significance of each item; assess the potential impacts to those items; recommend mitigation measures to reduce the level of heritage impact and identify other management or statutory obligations.

Overview of findings

This HIS has made the following conclusions:

- There are three listed heritage items in the vicinity of the proposed works:
  - Penrith Council Chambers (former) (Penrith Local Environmental Plan [LEP] 2010 Item No. 189)
  - TAFE Building (Penrith LEP 2010 Item No. 689)
  - Prospect Electricity Building (former) (Penrith LEP 2010 Item No. 701)
- There is one unlisted potential heritage item in the vicinity of the proposed works:
  - John Price & Son Funeral Home (former) assessed as of local significance
- The study area has been assessed as having nil potential to contain locally significant archaeological remains dating to the first European occupation phase of the site (1789 – c1850s), low potential to contain archaeological remains of local significance relating to the mid-late nineteenth century commercial development and occupation of the site (Phase 2: c1850s - c1900) and moderate potential to contain archaeological remains of local significance relating to the early twentieth century commercial development and occupation of the site (Phase 3: c1900-1950). There is potential that these remains would be considered 'relics' under the *NSW Heritage Act 1977.*
- The proposal has been assessed as having a:
  - Neutral direct (physical) impact to the Penrith Council Chambers (former) heritage item
  - Minor indirect (visual) impact to the Penrith Council Chambers (former) heritage item
  - Neutral direct (physical) impact to the TAFE Building heritage item
  - Minor indirect (visual) impact to the TAFE Building heritage item
  - Neutral direct (physical) impact to the Prospect Electricity Building (former) heritage item

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Minor indirect (visual) impact to the Prospect Electricity Building (former) heritage item
- Major direct (physical) impact (demolition) to the John Price & Son Funeral Home unlisted heritage item
- Major visual impact (demolition) to the John Price & Son Funeral Home potential heritage item
- Potential impact to areas assessed as demonstrating potential for archaeological remains.

Recommendations

The following recommendations would be considered during further development of the proposal design:

General

- Comprehensive photographic archival recording of the interiors and exteriors of the John Price & Son funeral home in accordance with relevant Heritage Division's guidelines should be conducted prior to demolition of the building. The photographic archival recording of each item would be carried out prior to works commencing, and in some cases, during the construction program. It should be prepared in accordance with the NSW Heritage Office's *How to Prepare Archival Records of Heritage Items* (1998), and *Photographic Recording of Heritage Items Using Film or Digital Capture* (2006) by a suitably qualified heritage consultant using archival-quality material.
- A 3D scan or photogrammetry of the John Price & Son funeral home should be considered in addition to the photographic archival recording.
- The ornamental octagonal fountain from the John Price & Son funeral home will be retained *in situ* and protected during works, and form part of the park landscaping following the completion of works.
- The stained glass windows and Chromatex bricks from the John Price & Son funeral home should be salvaged during demolition works.
- Where feasible, the Chromatex bricks from the John Price & Son funeral home should be reused in the park landscaping following the completion of works. If any damage is sustained by the octagonal fountain during works, these bricks may be suitable as replacements.
- A salvage methodology would be prepared for the octagonal fountain, Chromatex bricks and stained glass windows of the John Price & Son funeral home, detailing the specific recommendations for the safety of the items during the demolition process and possible next steps e.g., donation to local historical societies. Structural engineers would be consulted as part of this preparation.
- Opportunities for providing historical interpretive displays in the proposal design would be explored.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- All relevant staff, contractors and subcontractors should be made aware of their statutory obligations for heritage under *NSW National Parks and Wildlife Act 1974* and *NSW Heritage Act 1977*. This may be implemented as a heritage induction.

Archaeology

- As the potential for historical relics has been identified within the study area and the detailed design is currently unknown, archaeological testing under a Section 139 (s139) (1B) Exception permit is recommended. This would inform future designs for the proposal and involve:
  - A s139 (1B) exception permit application would be prepared and submitted to Heritage NSW, DPC for approval prior to works commencing
  - The s139 (1B) application will require the preparation of an archaeological research design (ARD), with an archaeological excavation methodology, which would be submitted in support of the permit application. The ARD should include additional primary research where required to inform the excavation methodology, and an impact assessment once the demolition methodology has been prepared by the demolition contractor
  - A program of archaeological test excavation and monitoring would be undertaken in accordance with the s139 conditions and ARD in areas assessed as containing potential for locally significant archaeological remains
  - Results derived from archaeological test excavations would be used to inform future detailed designs for the project including areas that should be avoided by subsurface impacts where feasible.
- If archaeological remains are found during testing and impacts cannot be avoided, a Section 140 Excavation permit would be required from Heritage NSW:
  - A s140 excavation permit application would be prepared and submitted to Heritage NSW, DPC for approval prior to works commencing
  - This would require the preparation of an archaeological research design (ARD), with a historical archaeological excavation methodology, which would be submitted in support of the permit application
  - A program of archaeological salvage excavation would be undertaken in accordance with the s140 conditions and ARD.
- An Unexpected Finds Procedure would be prepared as part of the archaeological investigations. The NSW Heritage Division would be notified of the discovery of a relic in accordance with Section 146 of the NSW Heritage Act 1977.

Vibration impacts

- During construction and demolition works, monitoring of vibration impacts to the locally significant former Council Chambers (Penrith LEP 2010 Item No. 189), TAFE Building (Penrith LEP 2010 Item No. 689) and former Prospect Electricity Building (Penrith LEP 2010 Item No.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

701) would be undertaken by structural engineers or a vibration specialist. Assessment and monitoring of vibration impacts would adhere to the:

  - British Standard BS 7385: *Part 2: Evaluation and Measurement for Vibrations in Buildings – Part 2 Guide to Damage Levels from Ground-Borne Vibration*
  - German Standard DIN 4150 *Part 3: Structural Vibration in Buildings: Effects on Structures.*

- If vibration monitors are necessary for listed heritage items, non-invasive adhesive methods such as beeswax would be considered.
- If it is identified that levels of vibration would result in damage to heritage fabric associated with the listed heritage items, works must cease and the construction methodology be reviewed by project engineers in consultation with a heritage consultant to mitigate further impacts.

ABBREVIATIONS AND GLOSSARY

Acronym	Description
Archaeological remains	Relics or work of local or state significance
CHL	Commonwealth Heritage List
DCP	Development Control Plan
EIS	Environmental Impact Statement
EP&A Act	*Environmental Planning and Assessment Act* 1979
EPBC Act	*Environment Protection and Biodiversity Conservation Act* 1999
HCA	Heritage Conservation Area
Heritage NSW, DPC	Heritage NSW, Department of Premier and Cabinet
HIS	Heritage Impact Statement
ICOMOS	International Council on Monuments and Sites
LEP	Local Environmental Plan
LGA	Local Government Area
NHL	National Heritage List
NSW	New South Wales
OEH	Office of Environment and Heritage
Relic	Any deposit, artefact, object or material evidence that relates to the settlement of the area that comprised New South Wales, not being Aboriginal settlement, and is of State or local significance
SHI	State Heritage Inventory
SHR	State Heritage Register
UNESCO	United Nations Educational, Scientific and Cultural Organisation
Works	Evidence of significant infrastructure that may be buried and archaeological in nature
WHL	World Heritage List

1.0 INTRODUCTION

1.1 Background

Penrith City Council (Council) has proposed to establish a City Park at the corner of Station Street and Henry Street, Penrith (the proposal). The City Park will be a vibrant green space that is a destination for residents, workers and visitors and a stimulant for the day- and night-time economy of the area.

In July 2020, Artefact Heritage prepared a preliminary heritage assessment report outlining Aboriginal and non-Aboriginal archaeological potential and identifying the built heritage and heritage-listed items of the study area. The report also included brief identification of heritage constraints and opportunities as relevant to the project. Artefact Heritage has been engaged by JMD Design on behalf of Council to provide a HIS for the proposal addressing non-Aboriginal (historic) heritage values within the study area.

The aim of this HIS is to identify listed and non-listed heritage items and archaeological remains which may be impacted by the proposal; determine the level of heritage significance of each item; assess the potential impacts to those items; recommend mitigation measures to reduce the level of heritage impact and identify other management or statutory obligations.

1.2 Study area

The study area is located at the corner of Station and Henry Streets, Penrith, within the City of Penrith Local Government Area (LGA), approximately 55 kilometres (km) west of the Sydney Central Business District (Figure 1). The study area comprises a 0.87 hectare portion of land currently occupied by car parking and twentieth century commercial development. The lots included within the study area comprise Lot 3 DP 1200790, Lot 1 DP 526304, Lot E DP 163176, Lot 2 DP 556075, Lot 10 DP 5536655, Lot 11 DP 5536655, Lot 1 DP 164798, Lot 1 DP 252457 and Lot 1 DP 254763.

The proposed site of the City Park (the study area) is shown in Figure 1.

1.3 Proposal

Council has proposed to create a City Park in the study area (Figure **1**). The proposal would involve the demolition of all existing structures within the study area and remediation of the site.

Key features of the proposal are to provide:

- An irrigated central lawn
- Super advanced trees and mass planting
- Recycled brick paving
- Custom designed amenities building with storage
- Public art
- Sustainable water feature (or water features) with interactive elements
- Quality and durable fixtures, fittings, and furniture (i.e., seating, bubblers, display banner poles, lighting)
- Sustainability and smart park elements (technology / smart city innovation)
- Waste innovation (for properties adjacent to the park)
- Signage distinct to Penrith

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Performance space 'Urban canopy / built and natural shade'
- WSUD, upgrade kerb and gutters
- Construct and re-surfacing the impacted road pavement.

1.4 Design stage

The current design will be submitted to Council with a Development Application (DA) for the proposed City Park.

The design process has included the following consultation:

1. Community Consultation in December 2019 to inform on how people would like to use the park, and what features should be included (by Penrith City Council)
2. Consultation with Businesses and property owners in August 2020 to inform on the Concept design and confirm operational requirements for Businesses (by JOC consulting)
3. Community Consultation in November 2020 to seek feed-back on the preliminary DA Plans (by Penrith City Council)

1.5 Report structure

The structure and content of this report is as follows:

- **Chapter 1** (this chapter) – Project background and description
- **Chapter 2** – An overview of report methodology
- **Chapter 3** – The heritage management framework including the legislative and policy context, and relevant criteria applicable to the proposal
- **Chapter 4** – An overview of the historical context of the study area
- **Chapter 5** – A description of the site and findings from the site inspection
- **Chapter 6** – An assessment of archaeological potential and significance within the study area
- **Chapter 7** – An assessment of significance of heritage items within the study area
- **Chapter 8** – An overview of impacts to heritage items and archaeology arising from the proposal
- **Chapter 9** – Conclusions and recommended measures to mitigate and manage potential impacts
- **Chapter 10** – References of sources used in the preparation of this report.

1.6 Limitations and constraints

This report has been informed by the previous draft Aboriginal and Non-Aboriginal Heritage Assessment of the study area prepared by Artefact Heritage (2020). The HIS builds upon the information within the preliminary report, with additional research and an additional site visit undertaken. This assessment has included a search of S170 items listed in the NSW State Heritage Inventory (SHI) only.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

1.7 Authorship

This report was prepared by Darrienne Wyndham (Heritage Consultant, Artefact Heritage), Olivia Turner (Heritage Consultant, Artefact Heritage) and Jessica Horton (Heritage Consultant, Artefact Heritage).

Adele Zubrzycka (Senior Heritage Consultant, Artefact Heritage), Jenny Winnett (Principal, Artefact Heritage), Josh Symons (Technical Director, Artefact Heritage) and Dr Sandra Wallace (Managing Director, Artefact Heritage) provided input and review.

2.0 METHODOLOGY

2.1 Identification of heritage listed items

Heritage listed items within and within 50 metres (m) of the study area were identified through a search of relevant state and federal statutory and non-statutory heritage registers:

- World Heritage List
- Commonwealth Heritage List
- National Heritage List
- State Heritage Register
- Penrith Local Environmental Plan (LEP) 2010
- Section 170 Heritage and Conservation Registers
- NSW State Heritage Inventory database.

Items listed on these registers have been previously assessed against the NSW Heritage Assessment guidelines (as outlined in Section 2.3.1). Statements of heritage significance, based on the NSW Heritage Assessment guidelines, as they appear in relevant heritage inventory sheets and documents, are provided in this assessment.

Where relevant Conservation Management Plans (CMPs) and other heritage management documents and guidelines have been utilised to provide additional information regarding heritage significance. Where used, these have been cited.

2.2 Identification of unlisted potential heritage items

During the preparation of the initial Aboriginal and Non-Aboriginal Heritage Assessment for the proposal, an unlisted structure with potential for heritage significance was identified by Artefact Heritage. This HIS provides an outline of the history of this structure, a local funeral home (c1954), and assesses the heritage significance of the potential heritage item against the NSW Heritage Assessment Criteria (see Section 7.1.4).

2.3 Assessment of archaeological potential

Historical archaeological potential is defined as the potential of a site to contain historical archaeological relics, as classified under the NSW *Heritage Act 1977*. 'Archaeological potential' refers to the likelihood that an area contains physical remains associated with an earlier phase of occupation, activity or development of that area. This is distinct from 'archaeological significance' and 'archaeological research potential'. These designations refer to the cultural value of potential archaeological remains and are the primary basis of the recommended management actions included in this document.

The assessment of historical archaeological potential is based on the identification of former land uses and evaluating whether subsequent actions (either natural or human) may have impacted on archaeological evidence for these former land uses. Knowledge of previous archaeological investigations, understanding of the types of archaeological remains likely to be associated with various land uses, and the results of site inspection are also taken into consideration when evaluating the potential of an area to contain archaeological remains.

Assessments of significance are preliminary in nature and, where possible, significance has been assessed against the NSW Heritage Assessment Criteria. The assessment is informed by the NSW

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Heritage Division's 2009 guidelines *Assessing Significance for Historical Archaeological Sites and Relics.*

The following grading of archaeological potential has guided the assessment of archaeological potential in this report.

Table 1: Grades of archaeological potential

Grading	Justification
Nil	No evidence of historical development or use, or where previous impacts such as deep basement structures would have removed all archaeological potential.
Nil to Low Potential	Where there has only been low intensity historical activity, such as land clearance or informal land use, with little to no archaeological 'signature' expected; or where previous impacts were extensive, such as large-scale bulk excavation which would leave isolated and highly fragmented deposits.
Low	Research indicates little or low intensity historical development, or where there have been substantial previous impacts, disturbance and truncation in locations where some archaeological remains such as deep subsurface features may survive.
Moderate	Analysis demonstrates known historical development and some previous impacts, but it is likely that archaeological remains survive with some localised truncation and disturbance.
High	Evidence of multiple phases of historical development and structures with minimal or localised twentieth century development impacts, and it is likely the archaeological resource would be largely intact.

2.3.1 NSW Heritage assessment guidelines

Determining the significance of heritage items or a potential archaeological resource is undertaken by utilising a system of assessment centred on the *Burra Charter* of Australia ICOMOS. The principles of the charter are relevant to the assessment, conservation and management of sites and relics. The assessment of heritage significance is outlined through legislation in the Heritage Act and implemented through the *NSW Heritage Manual* and the *Archaeological Assessment Guidelines*.[1]

If an item or archaeological resource meets one of the seven heritage criteria, and retains the integrity of its key attributes, it can be considered to have heritage significance. The significance of an item or potential archaeological site can then be assessed as being of local or state significance. If a potential archaeological resource does not reach the local or state significance threshold, then it is not classified as a relic under the Heritage Act.

'State heritage significance', in relation to a place, building, work, relic, moveable object or precinct, means significance to the State in relation to the historical, scientific, cultural, social, archaeological, architectural, natural or aesthetic value of the item.

'Local heritage significance', in relation to a place, building, work, relic, moveable object or precinct, means significance to an area in relation to the historical, scientific, cultural, social, archaeological, architectural, natural or aesthetic value of the item.[2]

The overall aim of assessing archaeological significance is to identify whether an archaeological resource, deposit, site or feature is of cultural value. The assessment will result in a succinct

[1] NSW Heritage Office 1996; 25-27
[2] This section is an extract based on the Heritage Office Assessing Significance for Historical Archaeological Sites and Relics 2009:6.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

statement of heritage significance that summarises the values of the place, site, resource, deposit or feature. The heritage significance assessment criteria are as follows:

Table 2: NSW heritage assessment criteria

Criteria	Description
A – Historical Significance	An item is important in the course or pattern of the local area's cultural or natural history.
B – Associative Significance	An item has strong or special associations with the life or works of a person, or group of persons, of importance in the local area's cultural or natural history.
C – Aesthetic or Technical Significance	An item is important in demonstrating aesthetic characteristics and/or a high degree of creative or technical achievement in the local area.
D – Social Significance	An item has strong or special association with a particular community or cultural group in the local area for social, cultural or spiritual reasons.
E – Research Potential	An item has potential to yield information that will contribute to an understanding of the local area's cultural or natural history.
F – Rarity	An item possesses uncommon, rare or endangered aspects of the local area's cultural or natural history.
G - Representativeness	An item is important in demonstrating the principal characteristics of a class of NSW's cultural or natural places of cultural or natural environments (or the cultural or natural history of the local area).

2.3.2 Archaeological research potential

In 1984, Bickford and Sullivan examined the concept and assessment of archaeological research potential; that is, the extent to which archaeological resources can address research questions. They developed three questions which can be used to assess the research potential of an archaeological site:

- Can the site contribute knowledge that no other resource can?
- Can the site contribute knowledge that no other site can?
- Is this knowledge relevant to:
  - General questions about human history?
  - Other substantive questions relating to Australian history?
  - Other major research questions?

In the 2009 guidelines *Assessing Significance for Historical Archaeological Sites and 'Relics'*, the NSW Heritage Division has since provided a broader approach to assessing the archaeological significance of sites, which includes consideration of a site's intactness, rarity, representativeness, and whether many similar sites have already been recorded, as well as other factors. This document acknowledges the difficulty of assessing the significance of potential subsurface remains, because the assessment must rely on predicted rather than known attributes.[3]

A site can have high potential for archaeological remains, and yet still be of low research potential if those remains are unlikely to provide significant or useful information.

[3] NSW Heritage Branch 2009

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

2.4 Assessment of heritage impact

This HIS has been prepared using the document *Statement of Heritage Impact* 2002, prepared by the NSW Heritage Office, contained within the *NSW Heritage Manual,* as a guideline.

Impacts on heritage are identified as either:

- Direct impacts, resulting in the demolition or alteration of fabric of heritage significance
- Indirect impacts, resulting in changes to the setting or curtilage of heritage items or places, historic streetscapes or views
- Potential direct impact, resulting in impacts from vibration and demolition of adjoining structures.

Specific terminology and corresponding definitions are used in this assessment to consistently identify the magnitude of the project's direct, indirect or potentially direct impacts on heritage items or archaeological remains. The terminology and definitions are based on those contained in guidelines produced by the International Council on Monuments and Sites (ICOMOS) [4] and are shown in Table 3. It is assumed that all direct and potential direct impacts are a result of construction. Indirect impacts are assumed to be operational unless specified as temporary in which case they are related to construction.

Table 3: Terminology for assessing the magnitude of heritage impact.

Magnitude	Definition
Major	Actions that would have a long-term and substantial impact on the significance of a heritage item. Actions that would remove key historic building elements, key historic landscape features, or significant archaeological materials, thereby resulting in a change of historic character, or altering of a historical resource. These actions cannot be fully mitigated.
Moderate	This would include actions involving the modification of a heritage, including altering the setting of a heritage item or landscape, partially removing archaeological resources, or the alteration of significant elements of fabric from historic structures. The impacts arising from such actions may be able to be partially mitigated.
Minor	Actions that would results in the slight alteration of heritage buildings, archaeological resources, or the setting of an historical item. The impacts arising from such actions can usually be mitigated.
Negligible	Actions that would results in very minor changes to heritage items.
Neutral	Actions that would have no heritage impact.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.0 HERITAGE MANAGEMENT FRAMEWORK

3.1 Introduction

There are several items of legislation relevant to the project. Heritage listed items within 50 m of the study area were identified through a search of the following relevant state and federal statutory and non-statutory heritage registers, the results are included in the relevant sections below:

- World Heritage List
- Commonwealth Heritage List
- National Heritage List
- State Heritage Register
- Penrith LEP 2010
- Section 170 registers.

Items listed on these registers have been previously assessed against the NSW Heritage Assessment guidelines, as summarised in Table 2. Statements of heritage significance based on the NSW Heritage Assessment guidelines as they appear in relevant heritage inventory sheets and documents are provided in this assessment.

3.2 Environmental Protection and Biodiversity Conservation Act 1999

The *Environment Protection and Biodiversity Conservation Act 1999* (Cwlth) (EPBC Act) provides a legislative framework for the protection and management of matters of national environmental significance, that is, flora, fauna, ecological communities and heritage places of national and international importance. Heritage items are protected through their inscription on the World Heritage List, Commonwealth Heritage List or the National Heritage List.

The EPBC Act stipulates that a person who has proposed an action that will, or is likely to, have a significant impact on a World, National or Commonwealth Heritage site must refer the action to the Minister for the Environment (hereafter Minister). The Minister will then determine if the action requires approval under the EPBC Act. If approval is required, an environmental assessment would need to be prepared. The Minister would approve or decline the action based on this assessment.

A significant impact is defined as “an impact which is important, notable, or of consequence, having regarded to its context or intensity.” The significance of the action is based on the sensitivity, value and quality of the environment that is to be impacted, and the duration, magnitude and geographic extent of the impact. If the action is to be undertaken in accordance with an accredited management plan, approval is not needed and the matter does not need to be referred to the Minister.

3.2.1 Commonwealth Heritage List

The Commonwealth Heritage List (CHL) has been established to list heritage places that are either entirely within a Commonwealth area, or outside the Australian jurisdiction and owned or leased by the Commonwealth or a Commonwealth Authority. The CHL includes Indigenous, historic, and natural heritage places owned or controlled by the Australian Government that reflect Australia’s development as a nation.

There are no heritage items listed on the CHL located within, or 50 metres of, the study area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

3.2.2 National Heritage List

The National Heritage List (NHL) has been established to list places of outstanding heritage significance to Australia. It includes natural, historic and Indigenous places that are of outstanding national heritage value to the Australian nation.

There are no heritage items listed on the NHL located within, or 50 metres of, the study area.

3.3 NSW Heritage Act 1977

The NSW *Heritage Act 1977* (Heritage Act) is the primary piece of State legislation affording protection to heritage items (natural and cultural) in NSW. Under the Heritage Act, 'items of environmental heritage' include places, buildings, works, relics, moveable objects and precincts identified as significant. Significance is based on historical, scientific, cultural, social, archaeological, architectural, natural or aesthetic values. State significant items can be listed on the NSW State Heritage Register (SHR) and are given automatic protection under the Heritage Act against any activities that may damage an item or affect its heritage significance. The Heritage Act also protects 'relics', which can include archaeological material, features and deposits.

Under the Heritage Act, all government agencies are required to identify, conserve and manage heritage items in their ownership or control. Section 170 of the Act requires all government agencies to maintain a Heritage and Conservation Register that lists all heritage assets and an assessment of the significance of each asset. They must also ensure that all items inscribed on its list are maintained with due diligence in accordance with State Owned Heritage Management Principles approved by the Government on advice of the NSW Heritage Council. These principles serve to protect and conserve the heritage significance of items and are based on NSW heritage legislation and guidelines.

3.3.1 State Heritage Register

The SHR was established under Section 22 of the Heritage Act and is a list of places and objects of particular importance to the people of NSW, including archaeological sites. The SHR is administered by the Heritage NSW, Department of Premier and Cabinet (Heritage NSW, DPC) and includes a diverse range of over 1500 items, in both private and public ownership. To be listed, an item must be deemed to be of heritage significance for the whole of NSW.

There are no heritage items listed on the SHR located within, or 50 metres of, the study area.

3.3.2 Section 170 registers

Under the Heritage Act all government agencies are required to identify, conserve and manage heritage items in their ownership or control. Section 170 (s170) requires all government agencies to maintain a Heritage and Conservation Register that lists all heritage assets and an assessment of the significance of each asset. They must ensure that all items inscribed on its list are maintained with due diligence in accordance with State Owned Heritage Management Principles approved by the government on advice of the NSW Heritage Council. These principles serve to protect and conserve the heritage significance of items and are based on NSW heritage legislation and guidelines.

There are no heritage items listed on the s170 registers located within, or 50 metres of, the study area.

3.3.3 Relics provisions

The Heritage Act also provides protection for 'relics', which includes archaeological material or deposits. The primary aim of an archaeological significance assessment is to identify whether an archaeological resource, deposit, site or feature is of cultural value and therefore, considered to be a

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

'relic'.[1] Historical archaeological sites typically contain a range of different elements as vestiges and remnants of the past. Such sites will include 'relics' of significance in the form of deposits, artefacts, objects and usually also other material evidence from demolished buildings, works or former structures which provide evidence of prior occupations but may not be 'relics' ('works' – see Section 3.3.4).[2]

According to Section 139 (Division 9: Section 139, 140-146):

> 1. *A person must not disturb or excavate any land knowingly or having reasonable cause to suspect that the disturbance or excavation will or is likely to result in a relic being discovered, exposed, damaged or destroyed unless the disturbance is carried out in accordance with an excavation permit.*
>
> 2. *A person must not disturb or excavate any land on which the person has discovered or exposed a relic except in accordance with an excavation permit.*
>
> 3. *This section does not apply to a relic that is subject to an interim heritage order made by the Minister or a listing on the State Heritage Register.*
>
> 4. *The Heritage Council may by order published in the Gazette create exceptions to this section, either unconditionally or subject to conditions, in respect of any of the following:*
>
> a) *Any relic of a specified kind or description,*
> b) *Any disturbance of excavation of a specified kind or description,*
> c) *Any disturbance or excavation of land in a specified location or having specified features or attributes,*
> d) *Any disturbance or excavation of land in respect of which an archaeological assessment approved by the Heritage Council indicates that there is little likelihood of there being any relics in the land.*

Section 4 (1) of the Heritage Act (as amended in 2009) defines a relic as:

> *...any deposit, artefact, object or material evidence that:*
>
> *relates to the settlement of the area that comprises New South Wales, not being Aboriginal settlement, and is of State or local heritage significance*

A relic has been further defined as:

> *Relevant case law and the general principles of statutory interpretation strongly indicate that a 'relic' is properly regarded as an object or chattel. A relic can, in some circumstances, become part of the land be regarded as a fixture (a chattel that becomes permanently affixed to land).*[5]

Excavation permits are issued by the Heritage Council of NSW, or its delegate, under Section 140 of the Heritage Act for relics not within an SHR curtilage or under Section 60 for significant

[1] OEH, Heritage Division, 2009. Assessing Significance for Archaeological Sites and 'Relics', p. 4
[2] OEH, Heritage Division, 2009. Assessing Significance for Archaeological Sites and 'Relics', p. 7
[5] *Assessing Significance for Archaeological Sites and 'Relics'*, Heritage Branch, Department of Planning, 2009:7.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

archaeological remains within an SHR curtilage. An application for an excavation permit must be supported by an Archaeological Research Design and Archaeological Assessment prepared in accordance with the Heritage NSW archaeological guidelines. Minor works that will have a minimal impact on archaeological relics may be granted an exception under Section 139 (4) or an exemption under Section 57 (2) of the Heritage Act.

3.3.4 Works

The Heritage Act defines 'works' as being in a separate category to archaeological 'relics'. 'Works' refer to remnants of historical structures which are not associated with artefactual material that may possess research value. 'Works' may be buried, and therefore archaeological in nature, however, exposure of a 'work' does not require approved archaeological excavation permits under the Act.

The following examples of remnant structures have been considered to be 'works' by the NSW Heritage Council:

- Former road surfaces or pavement and kerbing.
- Evidence of former drainage infrastructure, where there are no historical artefacts in association with the item.
- Building footings associated with former infrastructure facilities, where there are no historical artefacts in association with the item.
- Evidence of former rail track, sleepers or ballast.
- Evidence of former rail platforms and former platform copings.

Where buried remnants of historical structures are located in association with historical artefacts in controlled stratigraphic contexts (such as intact historic glass, ceramic or bone artefacts), which have the potential to inform research questions regarding the history of a site, the above items may not be characterised as 'works' and may be considered to be 'relics'. The classification of archaeological remains as a 'work' therefore is contingent on the predicted remains being associated with historical structures as well as there being no prediction of the recovery of intact artefactual deposits which may be of research interest.

3.4 Environmental Planning and Assessment Act 1979

The EP&A Act establishes the framework for cultural heritage values to be formally assessed in the land use planning, development consent and environmental impact assessment processes. The EP&A Act requires that environmental impacts are considered prior to land development; this includes impacts on cultural heritage items and places as well as archaeological sites and deposits. The EP&A Act also requires that local governments prepare planning instruments (such as LEPs) in accordance with the EP&A Act to provide guidance on the level of environmental assessment required.

The current study area falls within the boundaries of the Penrith City Council LGA and is subject to the Penrith LEP 2010.

The aim of the LEPs in relation to heritage is to conserve the heritage significance of heritage items and heritage conservation areas, including associated fabric, settings, views and archaeological sites. The LEP's list items of heritage significance within the LGA.

3.4.1 Penrith Local Environmental Plan 2010

The Penrith LEP aims to conserve the heritage significance of heritage items and heritage conservation areas, including associated fabric, settings and views; and to protect archaeological sites. The LEP lists sites assessed as being of local heritage significance and stipulate development

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

controls in relation to development proposed on or near heritage listed properties, archaeological sites, or Aboriginal places of heritage significance. Part 5 Clause 5.10 of the LEP lists the below objectives[6]:

> *(a) to conserve the environmental heritage of Penrith*
>
> *(b) to conserve the heritage significance of heritage items and heritage conservation areas, including associated fabrics, settings and views,*
>
> *(c) to conserve archaeological sites,*
>
> *(d) to conserve Aboriginal objects and Aboriginal places of heritage significance.*

There are three LEP listed items within 50 metres of the study area:

- Penrith Council Chambers (former) (Penrith LEP 2010 Item No. 189)
- TAFE Building (Penrith LEP 2010 Item No. 689)
- Prospect Electricity building (former) (Penrith LEP 2010 Item No. 701).

3.4.2 Penrith Development Control Plan 2014

The Penrith DCP 2014 is a supporting document that compliments the provisions contained within the Penrith LEP 2010 and provides specific design detail in regard to sympathetic development on, or in the vicinity of, items listed on Schedule 5 of the Penrith LEP 2010.

Part C 7.1.4 and 7.1.5 of the DCP 2014 provides sympathetic considerations for development that is in the vicinity of a heritage listed item and the Heritage Conservation Area (HCA). These considerations include ensuring that the character, bulk, scale and height of new development does not unreasonably overshadow a nearby heritage item, that colouring and texture of new materials of a new development is sympathetic to a heritage item, and that views of a heritage item should not be obscured from the point of view of areas of public domain.

3.5 Non-statutory registers

3.5.1 Register of the National Estate

The Register of the National Estate is a list of natural, Aboriginal and historic heritage places throughout Australia. It was originally established under the *Australian Heritage Commission Act* 1975. Under that Act, the Australian Heritage Commission entered more than 13,000 places in the register. Following amendments to the *Australian Heritage Council Act* 2003, the Register of the National Estate (RNE) was frozen on 19 February 2007 and ceased to be a statutory register in February 2012. The RNE is now maintained on a non-statutory basis as a publicly available archive and educational resource.

There are no heritage items listed on the RNE located within, or 50 metres of, the study area.

3.5.2 Register of the National Trust

The National Trust of Australia is a community-based, non-government organisation committed to promoting and conserving Australia's Indigenous, natural and historic heritage. The Register of the National Trust (RNT) was established in 1949. It is a non-statutory register.

[6] Penrith Local Environmental Plan, 2010. Penrith City Council Local Government Area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

There are no heritage items listed on the RNT located within, 50 metres of, the study area.

3.6 Unlisted potential heritage items

A single unlisted potential heritage item was identified by Artefact Heritage during the preparation of the preliminary Aboriginal and Non-Aboriginal Heritage Assessment for the proposal.[7] This potential item of heritage significance comprises the former John Price & Son funeral home located within the study area. A significance assessment is included in Section 7.1.4 of this report.

3.6.1 Summary of heritage listings

Table 4 provides a summary of heritage listed items within, or 50 metres of, the study area. These are illustrated in Figure 2.

Table 4: Summary of listings for heritage items in and near the study area.

Item	Listing	Level of significance	Address	Distance from study area
Penrith Council Chambers (former)	Penrith LEP 2010 Item No. 189	Local	129–133 Henry Street, Penrith 2750	15 metres north of study area
TAFE Building	Penrith LEP 2010 Item No. 689	Local	115–119 Henry Street, Penrith 2750	15 metres northeast of study area
Prospect Electricity building (former)	Penrith LEP 2010 Item No. 701	Local	59 Station Street, Penrith 2750	10 metres east of study area
John Price & Son Funeral Home (former)	Non-listed	Local	42-44 Station Street, Penrith 2750	Within study area

4.0 HISTORICAL CONTEXT

This section has been adapted from the history provided in Artefact Heritage's Aboriginal and Non-Aboriginal Heritage Assessment for Penrith City Park (2020).

4.1 Aboriginal history

Prior to the appropriation of their land by Europeans, Aboriginal people lived in small family or clan groups that were associated with particular territories or places. It seems that territorial boundaries were fairly fluid, although details are not known. The language group spoken on the Cumberland Plain is known as Darug (Dharruk – alternative spelling). This term was used for the first time in 1900[8], as before the late 1800s language groups or dialects were not discussed in the literature.[9] The Darug language group is thought to have extended from Appin in the south to the Hawkesbury River, west of the Georges River, Parramatta, the Lane Cove River and to Berowra Creek.[10] This area was home to a number of different clan groups throughout the Cumberland Plain. It is thought that the Aboriginal people living in the Penrith area in the early nineteenth century belonged to the Darug language group.[11]

The British initially thought that Aboriginal people did not live inland but were confined to the coast taking advantage of the abundant marine resources available. The first major expeditions into the interior did not witness any Aboriginal people, but evidence of their existence was noted. In 1789 Captain Watkin Tench led an expedition to the Nepean River.[12] He noted that;

> *Traces of the natives appeared at every step, sometimes in their hunting huts which consist of nothing more than a large piece of bark bent in the middle and opened at both ends, exactly resembling two cards set up to form an acute angle; sometimes in marks on trees which they had climbed; or in squirrel-traps…. We also met with two old damaged canoes hauled up on the beach.*

It was not until rural settlement began in the western Cumberland Plain, around 1791 that the colonists and Aboriginal people came face to face. Relations quickly disintegrated, and tensions over land and resources spilled over. Governor King sanctioned the shooting of Aboriginal people in a General Order made in 1801.[13] Intermittent killings on both sides continued for over 15 years, including the Appin massacre and attacks at South Creek in 1816.[14] [15]

British colonisation had a profound and devastating effect on the Aboriginal population of the Sydney region, including Darug speakers. In the early days of the colony Aboriginal people were disenfranchised from their land as the British claimed areas for settlement and agriculture. The colonists, often at the expense of the local Aboriginal groups, also claimed resources such as grassland, timber, fishing grounds and water sources. Overall, the devastation of the Aboriginal culture did not come about through war with the British, but instead through disease and forced

removal from traditional lands. It is thought that during the 1789 smallpox epidemic, over half of the Aboriginal people of the Sydney region died. The disease spread west to the Darug of the Cumberland Plain and north to the Hawkesbury. It may have in fact spread much further afield, over the Blue Mountains.[16] This loss of life meant that some of the Aboriginal groups who lived away from the coastal settlement of Sydney may have disappeared entirely before Europeans could observe them or record their clan names.[17]

Descendants of Darug language speakers continued to live in Western Sydney along with Aboriginal people from other areas of NSW, and in the present-day, the study area falls within the area of the Deerubbin LALC.

4.2 Early development of Penrith

Exploration west of Parramatta, within the Nepean Region, began shortly after the arrival of the First Fleet, with the first expedition conducted by Captain Watkin Tench in 1789. The following year, Tench and Lieutenant William Dawes further explored the area, discovering the Nepean River which Tench described as being as 'broad as the Thames at Putney'.[18]

Land within the Penrith region was being granted by the early 1800s, the first of which was awarded to Captain Daniel Woodriffe in 1804 (1000 acres). Woodriffe's grant covered the majority of present-day Penrith (including the study area), straddling the parishes of Castlereagh and Mulgoa (Figure 3 - Figure 4).[19] Woodriffe named the property Rodley Farm however it is likely that he never resided at the property as he left for England in the same year. The farm was leased to William Martin until 1821.

Arguably one of the most significant motivators in the development of Penrith were the transport and communication routes established from Sydney through Penrith and across the Blue Mountains. Following the expedition across the Blue Mountains by Gregory Blaxland, William Lawson and William Wentworth in 1813, Surveyor George Evans journeyed further west and surveyed a route extending from Penrith to the eventual site of Bathurst.[20] A government punt was established at this time to cross the Nepean River, which was operated by William Martin who provided refreshments, accommodation and goods for waiting travellers.[21] A single-track railway line to Penrith was opened in 1863 (180 metres north of the study area). The railway line runs directly through the 1000-acre Woodriffe land grant (Figure 5). The line was duplicated in 1886, and with the extension over the Blue Mountains, Penrith became an important railway centre.[22]

The Woodriffe property was leased to John and Sarah McHenry in 1821, who also owned the adjoining property. McHenry was critical of Martin's lack of enterprise at the property stating that it was 'in a state of nature'. The McHenrys hired clearing gangs from the Emu Plains convict farm to improve the productivity of the estate.[23] The estate was divided into two leases in 1830, one either side of the Great Western Road. John McHenry continued to lease the northern side (including the study area), whilst Jacob Josephson leased the southern side.

Upon Woodriffe's death, the farm was divided in two and inherited by Francis Henry Woodriffe and his brother Frederick Daniel Woodriffe.[24] When the McHenry and Josephson lease expired in 1851, the Woodriffe property was divided into farm and town lots and leased in 1852 to sixteen tenants. These tenants included Philpott Robbins, Edward Heavy, William Barlow and Henry Wilson.[25] By the late 1800s, Francis Henry Woodriffe had established 'Combewood' House (extant) off Castlereagh Road, north of the railway line; and his brother Frederick Daniel Woodriffe had completed work on 'Rodley' House (demolished) off Mulgoa Road, south of the railway line.

The Woodriffe Estate became known as Lower Penrith, and although it was low-lying and flood prone, farms, hotels, shops and houses were developed creating a community of workers, farmers and business people.[26] Notable developments within Penrith during these early years included the colony's first Georgian manor, Regentville House in 1824 (burned down in 1868); a post office opened in 1828; St Stephens Anglican Church consecrated in 1839; St Nicholas of Myra Catholic Church consecrated in 1850, the first bridge over the Nepean built in 1856 (washed away by flood 1857); and a school established in 1865. Penrith became a municipality in 1871, and an official city in 1959.[27]

4.3 Development of the study area

The study area falls within the original 1000-acre land grant made to Captain Daniel Woodriffe in 1804. Following its lease to the McHenrys in 1821, the land was cleared and used for agricultural purposes. Though the exact nature of the agricultural/pastoral uses of the study area are unknown, it is likely that the land was cleared of vegetation and fenced. Following the establishment of the railway north of the study area in 1863, an orchard was established on the Woodriffe grant; however, this orchard was known to have been planted north of the railway line. An 1883 parish map shows the existence of the railway line, with an established road leading to Parramatta located south of the study area (Figure 5). There is no sign of any structures in the area at this time.

By the late 1880s, development south of the railway line had increased rapidly. A c1880 subdivision plan of Penrith indicates that streets including Station, Henry and High Street were in place by this time, close to their current alignments (Figure 6). Development along High Street was flourishing, with structures including two 'stores', a 'shop' and a hotel clearly labelled on the subdivision map. It is likely that these businesses, the largest in the plan, would have included rear yards and possible outbuildings; however, these types of buildings were rarely included on subdivision plans. Outbuildings may have included privies, sheds and stables. Five structures, labelled as 'shops' on the subdivision plan, can be seen within the study area on Henry Street. These structures are significantly smaller than the High Street businesses.

As Penrith grew, more local businesses appeared in the study area. By 1886, Mr William G. Ransley and his business partner Mr. Dormer had opened a Livery and Bait Stables on the corner of Henry and Station Streets, in the northwest corner of the study area.[28] The business supplied buggies, waggonettes and saddle horses for hire alongside land and stables for residents to board their horses.[29] At some time after 1886, the business began operating under the name W.G. Ransley.[30]

In July 1888, Ransley had gone into business with John Priddle and the pair were offering buggies and waggonettes to Riverstone as well as furniture removal services.[31] However, by November 1889 the pair had dissolved their partnership and the business had been transferred to Priddle.[32] Priddle and his wife Louisa resided at the property and subsequently expanded the business to include a blacksmith's shop and lolly shop.[33] The lolly shop was run by Louisa and occupied a building next door. It is likely that the small buildings seen in the c1880 subdivision plan (Figure 6) were demolished or modified to make way for the Priddle businesses.

In 1908, Louisa sold the businesses to Nelson Price, a local merchant and undertaker, following the John Priddle's death in 1897.[34] Though no images of High Street are available at the time, photographs of Station and High Streets in the c1910s show the general nature of the commercial structures south of the study area (Figure 7 and Figure 8). The majority of buildings along High Street were two-storey commercial premises with extensive verandahs. A photograph from c1919 shows the 'States Boot Manufacturing Company', a business that occupied the corner of Station and High Streets south of the study area (Figure 8). The large store included a shaded portico and balcony with iron lace detailing. It is likely that the yard areas and outbuildings associated with the High Street businesses, including the States Boot Manufacturing Company, extended into the southern portion of the study area.

By the 1940s, development occupied the majority of the study area. An aerial photograph of Penrith from 1943 shows the study area occupied by medium-sized structures and outbuildings. At this time, the north-eastern corner of the study area remained relatively undeveloped, with a small structure and associated yard present in the aerial (Figure 9). The aerial also shows the development of a roadway/lane inside the study area, roughly following the present-day alignment of Allen Place. This may have been used as a night soil lane prior to the introduction of formalised sewerage systems in the twentieth century.

The Priddle businesses, now owned by Nelson Price, are discernible in the north-western portion of the study area. Multiple rear yards associated with the High Street businesses comprise the southern portions of the study area, with outbuildings of various sizes clearly visible. These businesses included a Commonwealth Employment Office at 505 High Street (1930s-1950s), Dry Cleaners and Dyers at 503 High St (1930-1950s), Hardware, Crockery and Appliance Store at 499 High Street, and Handleys Home Appliance specialists (1940-1950s). Though the exact nature of the outbuildings is unknown, it is likely that they were similar in nature and materials to a nearby rear yard in Henry Street (Figure 11). The outbuildings in the Henry Street yard were simply fashioned and made of timber and corrugated iron.

Following the Second World War, the study area underwent a large-scale demolition, with modern development occurring in the 1950s and 1960s. All buildings featured in the 1940s aerial were demolished during this time, with the John Price & Son funeral home and other mid-twentieth century shops built within the study area. A number of government and civic buildings were constructed adjacent to the study area during this period, including the former Penrith Council Chambers, TAFE Building and Prospect Electricity Building. The Allen Place car park was established in within the study area in 1964 to provide extra car parking.[35]

A comparison of aerial imagery from 1980 - 2007 indicates that a multi-storey carpark was established along Allen Place by the 1980s, with an overpass to another multistorey carpark on Station Street (Figure 12 - Figure 16). The Allen Place multi -storey car park was demolished in 2017. The structures within the study area do not appear to change significantly throughout the late twentieth and early twenty-first century imagery, however it is likely that a number of internal and external modifications did take place.

4.3.1 John Price & Son Funeral Home

The corner of Station and Henry Streets (in the north-western corner of the study area) is known to have once been the site of a livery stable business, residence, lolly shop and blacksmith's shop, on land leased from the Woodriffe family. The original livery stables were operated by the Priddle family from the late 1800s until 1908, when Louisa Priddle sold the business to Nelson Price.[37] Price

Version: 1, Version Date: 14/04/2021

continued to operate the livery stables and blacksmith's shop, eventually purchasing the land from the Woodriffes in 1927 for 700 pounds. Price lived in the High Street residence from 1927.[38]

John Price & Son, a funeral business, had been established in Penrith in 1855 by John Price, an undertaker and monumental mason. John Price and his family resided on a property along Henry Street, next door to the former Methodist Church (Figure 11). The Price family was heavily involved in the funeral industry of Penrith, with John's son working as the undertaker, a nephew working as a gravedigger and a rival funeral business set up by Nelson and Arthur Price.[39] The well-respected business offered funeral services and carved gravestones and monuments; in 1922, the firm was engaged to carve the Penrith Soldiers Memorial tablets.[40] Upon John's death in the 1890s, his wife Elizabeth ran John Price & Son until her own passing in 1920; during this time the business was referred to as Mrs John Price & Son. The business was run for a short time by a Mr Leo Price. Nelson Price took over the business in 1924 and ran it alongside the livery stables and blacksmiths shop. Price moved to a new house at 480 High Street in 1927, continuing to operate the funeral business from his home.[41]

In 1949, Nelson sold his properties to the Rural Bank of NSW, dying a few days later.[42] The Rural Bank sold the property at the corner of Station and Henry Streets to William Frederick Smith of Penrith Motors in 1950, along with the business name of John Price & Son.[43] A funeral home was purpose-built on this site during Smith's period of ownership, likely in early 1954 (Figure 18). An article in the Nepean Times from November 1954 praised the 'architectural and structural beauty' of the new funeral home, stating:

> *The new structure is a thing of beauty and is a very modern type that will enhance the appearance of Station Street. The chapel and other rooms are very modern.*[44]

The funeral home was designed by Frederick Paskin of Penrith, and comprised a parlour, a large lounge, offices, ladies' retiring rooms, a chapel and clergy room.[45] A separate block at the rear of the property housed garages, workrooms, storerooms and amenities. The manager's residence was also incorporated into the funeral home, with bedrooms, a kitchenette, dining rooms and bathroom. The distinctive Flemish bond bricks were made from Chromatex bricks sourced from Heathcote. The ornamental garden in the front courtyard was laid by Mr. E Summons.[46] The designer of the unusual octagonal brick fountain in the front courtyard is unknown, but an image from 1957 shows the fountain in situ (Figure 18).

John Price & Son funeral home continued operation under various ownership up until 2014 when its name was changed to 'Supremacy Funerals'. Today, the business has officially moved from the building to another location on High Street south of the study area.[47]

5.0 SITE INSPECTION

5.1 Introduction

An inspection of the study area was undertaken by Darrienne Wyndham (Heritage Consultant, Artefact Heritage) and Olivia Turner (Heritage Consultant, Artefact Heritage) on 13 January 2021. A previous site visit had been conducted by Jessica Horton (Heritage Consultant, Artefact Heritage) on 22 July 2020 during the preparation of the preliminary heritage assessment report. The aim of the inspection was to investigate the exterior and interior of the former John Price & Son funeral home and identify and assess potential impacts of the proposed works to surrounding heritage items, including impacts to potential archaeological deposits within the study area and historic views and vistas.

The inspection was undertaken on foot, using physical maps and GPS. A photographic record was made during the inspection.

Access was provided to the interior of the funeral home and the rear outbuildings. Upper storey access was not permitted due to asbestos contamination.

5.2 Description

The study area is focused on the junction of Station Street with Henry Street and Allen Place, and is located within the central business district of Penrith. The wider setting of the study area is characterised by its context, featuring a combination of commercial development and car parking facilities. The structures within the study area are predominantly commercial, comprising a number of low-rise Post-Second World War shop fronts. A large parking facility is present in the southern and south-eastern portions of the study area.

All of the listed heritage items identified in Table 4 were visible from the study area during the site inspection, with view lines intact.

The surrounding landscape comprises commercial development and carparking facilities to the north, south and east, the former Penrith Council Chambers to the north, the TAFE Buildings to the northeast and the former Prospect Electricity Building to the west, which is now occupied by a dental practice and various other businesses. The Council Chambers and former Prospect Electricity building have a close and uninterrupted visual link with the site, with the corner location of the funeral home being directly opposite both.

5.3 John Price & Son Funeral Home

John Price & Son, the Post-War unlisted heritage item, is situated within the north-western portion of the study area. The funeral home stands out in the commercial area as a unique post-war residential scale building in the centre of the business area, visually separated from the surrounding buildings due to a large courtyard. The funeral home appears externally intact and very similar to c1957 images of the building, with only changes to ephemeral aspects of the setting such as plantings.

The exterior of the building is in good condition with the exception of missing or broken fascia and soffit boards to the south-western corner of the roof. The provenance of the terracotta roof tiles used was visible during the site inspection – with stamps indicating tiles were mostly produced by Porter & Galbraith of Doonside, NSW, though one tile (possibly a replacement) read Cumberland, Bankstown, NSW. The specific moulded brick employed in the construction of the building was also evident during site inspection with the ‘Chromatex’ stamp clearly visible on exposed brick bases.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Internally, the building is in good condition and appears to substantially retain internal features, fittings and finishes. Floorboards are the main flooring throughout the building, with minor areas of damage evident in the front parlour. Internal features including cornices remained intact. It is likely that the utilitarian interior design of the building remains true to its original form and operation. Light fittings appeared to post-date the construction of the building, and window fittings and glass appeared original.

No evidence of basement or cellar space was observed during the site visit, with a Council representative onsite confirming that no basement exists. The rear yard of the main building is concreted and connects to the concrete bases of the garage and service areas. Landscaping to the front courtyard of the building consisted of concrete paths and gravel fill. There was no surface evidence of any archaeological remains or former development observed during the site inspection.

6.0 ARCHAEOLOGICAL ASSESSMENT

6.1 Known land use

As discussed in the historical background section of this report, the study area has been subject to a number of land use phases, with three historical development phases and one modern development phase.

The study area has been used for commercial and residential activities since the nineteenth century, with use before that likely consisting of land clearance as part of the early land grants in the region. For the purposes of this assessment, the potential archaeology of the study area has been divided into the following phases:

- Phase 1: Early Land Grants (1789 – c1850)
- Phase 2: Nineteenth Century Commercial Development (c1850 – c1899)
- Phase 3: Early Twentieth Century Commercial Development (c1900 – c1950)
- Phase 4: Post-War Demolitions and Redevelopment (c1950s – present).

The following discussion of archaeological potential is focused on those areas identified as having the potential to contain archaeological resources. A map showing the locations of the known historical structures that occupied the study area is included in Figure 40.

6.1.1 Phase 1: Early Land Grants (1789 – c1850)

Phase 1 is defined by the first land grant in the study area, made to Captain Daniel Woodriffe in 1804.

Woodriffe left for England in 1804 and is not known to have built upon the land. Historical plans and parish maps indicate that the area was sparsely developed until the late nineteenth century, likely due to its inaccessibility and isolated nature prior to the coming of the railway.

Woodriffe's property (including the study area) was leased to William Martin in 1804. Records show that the land was largely untouched until 1821 when John and Sarah McHenry took over the property. During McHenry's lease of the property, extensive land clearing activities took place. No residences or other structures are shown in the study area on maps during this time. Undocumented tracks and accessways to the property may have been present.

The removal of vegetation for timber getting, and preparation of the land for agricultural use, would likely have been the earliest land-use in the study area. Activities such as tree clearance, fence construction, the development of unsealed roads and agricultural planting leave little material evidence and are not likely to be identified.

Potential remains from this land use phase may include evidence of agricultural/pastoral practices such as postholes and tree boles, although these would be highly ephemeral.

6.1.2 Phase 2: Nineteenth Century Commercial Development (c1850-c1899)

Phase 2 is defined by the initial large subdivision of the Woodriffe Estate in 1852 to sixteen tenants, with subsequent re-subdivision and development to accommodate a growing township.

A railway line was constructed in Penrith in 1863. This line was located 180m north of the study area, with the Penrith Railway Station also established to the north, outside of the study area.

During the 1880s and 1890s, the study area and surrounds were subdivided into smaller allotments to accommodate tenant farmers, shopkeepers, mechanics and labourers. This marks the first known development in the study area. A subdivision plan from c.1880 shows no evidence of development on

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Station Street between Henry Street and High Street (within the study area) by the late 1880s (Figure 6). However, it indicates that five small structures, most likely shops, were either present or intended to be located along Henry Street within in the north-western portion of the study area. Records indicate that by 1886, structures in the north-west corner of the study area are likely to have included a livery, stables and residence established by William Ransley in 1886 and eventually run by John and Louisa Priddle until the 1920s. The Priddles also established a blacksmiths shop and lolly shop on the property in the late 1880s. The establishment of the Priddle businesses in the northwest portion of the study area may have required the demolition/modification of earlier Henry Street shops, however there is not sufficient cartographic evidence available to confirm this.

The c.1880 plan also shows development along High Street to the south of the study area which is explicitly named as 'stores' or 'shops'. Outbuildings associated with these stores and shops may have extended into the southern portion of the study area at this time, though these would not have been included in subdivision plans. An aerial photograph taken in 1943 (Figure 9) does however confirm the presence of outbuildings within the southern portion of the study area. The location and configuration of these buildings suggests they represent development associated with High Street shops shown in Figure 6.

Potential archaeological remains from this land use phase may include evidence of drains, the Ransley/Priddle blacksmith's shop, livery stables/residence and lolly shop, including building footings and foundations, undocumented subsurface features such as cisterns, wells or cesspits and potential subsurface deposits associated with the businesses. Archaeological remains of the outbuildings associated with the High Street businesses may include building footings and undocumented subsurface features, such as cisterns, wells or cesspits, as well as yard scatters and postholes associated with the large yard spaces in the southern portion of the study area. There is potential for artefact-bearing deposits to be present within any undocumented subsurface features.

6.1.3 Phase 3: Early Twentieth Century Commercial Development (c1900 – c.1950)

Phase 3 is defined by the large-scale growth of the study area and surrounds into a commercial centre.

This included the State Boot Manufacturing Company located on the corner of Station and High Streets, a Commonwealth Employment Office at 505 High Street (1930s-1950s), a dry cleaners and dyers at 503 High St (1930-1950s), a hardware, crockery and appliance store at 499 High Street, and Handleys Home Appliance specialists (1940-1950s).

Outbuildings associated with the High Street businesses (shown in Figure 9) were demolished during the construction of the Allen Place carparking area in the 1960s.

A historical aerial photograph from 1943 (Figure 9) shows three large structures and four smaller outbuildings within the north-western portion of the study area, on land associated with the Ransley/Priddle blacksmiths shop and livery stables/residence (now run by Nelson Price). These structures may have been constructed on the site during Phase 2 in association with the livery stables, blacksmith and lolly shop activities on the site, or constructed during ongoing use of the site during Phase 3. Archaeological remains from these buildings may have been impacted by the construction of the John Price & Son funeral home during the subsequent land-use phase (Phase 4). As the extent of excavation undertaken during the construction of the funeral home is not known, the extent of these impacts is unknown.

6.1.4 Phase 4: Post-War Demolitions and Redevelopment (c1950-present)

Phase 3 is defined by the demolition of all Pre-War structures within the study area and large-scale Post-War redevelopment.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

A comparison of historical imagery from c1940s and mid-late twentieth century imagery indicates that the majority of the structures in and around the study area at that time were demolished by the late 1950s-c1960s. The study area was entirely redeveloped with Post-War architecture including commercial premises and the John Price & Son funeral home. This funeral home was constructed in 1954, requiring the demolition of the Ransley/Priddle/Price livery stables/residence and blacksmith's shop that previously occupied the north-western portion of the study area. As no basement was part of the site, it is likely that minimal excavation took place during the construction of the funeral home and archaeological remains of the livery stables/residence and blacksmith's shop may be present. It is unknown whether the surrounding commercial premises have basement areas, though this is unlikely.

The Allen Place carpark in the southern and eastern portions of the study area was in place from 1962, with a multi-storey carpark and overpass developed during the c1980s. The multi-storey carpark was demolished by 2017, with a ground level car parking facility remaining.

Potential archaeological remains from this land use phase include demolition fill from the Pre-War structures.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Figure 40. Known historical structures from Phases 2 and 3, using information taken from the 1888 subdivision plan and 1943 aerial of the study area. The Phase 2 outbuildings are undocumented; thus, the approximate area of these outbuildings is also included.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.2 Known disturbance

As described in Section 2.3, ongoing land use and development have the potential to disturb, remove or truncate archaeological evidence of past occupation phases. The known disturbances to the study area include the larger scale demolitions of Pre-War structures (Phase 2) in the c1950s-1960s and the 1962 car parking development (Phase 4) in the southern portion of the study area.

These developments would have cleared the study area of all Phase 2 and some Phase 3 buildings including the Ransley/Priddle/Price stables, livery, blackmith's shop and residence and Louisa Paddle's lolly shop. All Phase 2 outbuildings along the southern boundary of the study area (formerly associated with the High Street shops) were also cleared as part of these later developments. The laneway that ran between Henry and High Street also appears to have been modified or replaced by modern road corridors during Phase 4 occupation.

Although the extent of subsurface impacts associated with Phase 4 development is not known, it would have required some localised excavation and levelling to prepare the site for new buildings and utilities. However, no Phase 4 structures in the study area contain basements, suggesting no extensive excavation took place at this time. The construction of a multistorey parking facility, overpass and support structures in 1962 may have required shallow excavations for levelling as well as localised excavations for piles. It did not contain a basement level. The parking facility was demolished in 2017, with a single-level car park remaining in place.

These major impacts, especially to the southern portion of the study area, may have resulted in numerous localised impacts to potential archaeological remains associated with earlier land use phases. However, structural evidence of former buildings such as footing and foundations may survive, in addition to deep features such as cesspits and wells.

6.3 Assessment of archaeological potential

6.3.1 Phase 1: Early Land Grants (1789 – c1850)

Potential archaeological remains from this land use phase may include evidence of land clearing and agricultural/pastoral practices such as postholes demonstrating the location of former fence lines and tree boles. It is highly unlikely that any intact archaeological evidence of Phase 1 would be present within the study area. There is no evidence to suggest that any structures were present in the study area during this land use phase.

Development of the study area during subsequent phases, including the demolition of structures and redevelopment during the Post-War period, is likely to have significantly disturbed any potential archaeological remains from this phase. Therefore, there is **nil** archaeological potential for archaeological remains from Phase 1, including evidence of early land clearing such as postholes or tree boles.

There is nil potential for archaeological remains associated with Phase 1 to be present within the study area.

6.3.2 Phase 2: Nineteenth Century Commercial Development (c1850 – c1900)

Potential archaeological remains association with Phase 2 occupation may include evidence of the 1888 Henry Street shops, located in the northern portion of the study area. These comprise primarily of the Ransley/Priddle livery stables/residence, blacksmith's shop and lolly shop, which were run by Nelson Price from 1908 onwards. These remains may consist of drains, building footings and foundations, yard scatters, rubbish pits and undocumented subsurface structures such as cisterns, wells or cesspits. It is possible that deeper subsurface structures, like cesspits, wells or cisterns, may contain artefact-bearing deposits.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

In the southern portion of the study area, archaeological evidence of the c.1880s outbuildings associated with the High Street businesses may be present. These would include building footings and undocumented subsurface features, as well as yard scatters, rubbish pits and postholes associated with the large yard spaces.

The construction of the 1954 John Price & Son funeral home is likely to have impacted to a certain extent any archaeological remains in the north-western portion of the study area, with the Priddle/Price livery stables/residence and blacksmith's shop demolished and the site levelled. As no excavation for a basement took place during the funeral home's construction, it is likely that remains of building footings and deeper subsurface features have survived while surface features such as rubbish pits and yard scatters were removed or disturbed. Therefore, there is **moderate** potential for archaeological remains such as building foundations, footings and deeper subsurface features such as cisterns, cesspits or wells associated with the Price/Priddle businesses to be located in the north-western portion of the study area.

The construction of the Allen Place car parking facility in 1962 and subsequent expansion into a multistorey carpark in the 1980s are likely to have majorly impacted archaeological evidence in the southern portion of the study area. The construction would have involved large-scale levelling, with some excavation for supports likely to have been installed in the 1980s multistorey car park. Further excavation for the carp park, and its impacts on the archaeological resource, is unknown. As no subterranean levels exist in the car park, impacts may be localised and subsurface features may have survived. Therefore, there is **low** potential for remains of footings or foundations associated with the High Street outbuildings and undocumented subsurface structures such as cisterns.

There is moderate potential for archaeological remains associated with Phase 2 to be present within the north-western portion of the study area, and low potential for archaeological remains associated with Phase 2 to be present within the southern portion of the study area.

6.3.3 Phase 3: Early Twentieth Century Commercial Development (c1900 – c1950)

Archaeological remains associated with Phase 3 land use would primarily be associated with the ongoing use and modification of Phase 2 shops, residences and outbuildings in the study area. Evidence of these activities may have been disturbed or removed for construction activities associated with Phase 4 development, as discussed in Section 6.3.2 above. However, there is potential for structural and deep subsurface evidence of this occupation to survive.

There is moderate potential for archaeological remains associated with Phase 3 to be present within the north-western portion of the study area, and low potential for archaeological remains associated with Phase 3 to be present within the southern portion of the study area.

6.3.4 Phase 4: Post-War Demolitions and Redevelopment (c1950-present)

The construction activities occurring in Phase 4 are likely to have majorly impacted archaeological evidence from previous phases of occupation, notably the Allen Place carpark and the John Price & Son funeral home. Potential archaeological remains associated with Phase 4 would be limited to demolition fills associated with the Post-War redevelopment. This includes the demolition of the Priddle/Price livery stables/residence and blacksmith's shop in the north-western portion of the study area and the demolition of the outbuildings associated with the High Street shops.

There is moderate potential for archaeological remains associated with Phase 4 to be present within the study area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

6.4 Assessment of archaeological significance

This section assesses the heritage significance of the known or potential archaeological remains outlined in Section 6.2. Similar to other types of heritage items, archaeological remains should be managed in accordance with their significance. Assessing the heritage value of archaeological remains is complicated by the fact that their extent and nature is often unknown. Judgement must therefore be based on expected or potential attributes.

The significance of the potential archaeological resource has been assessed using the NSW heritage assessment criteria and is outlined in Table 5.

Table 5. Assessment of archaeological significance against the NSW Heritage assessment criteria

Criterion	Discussion
A) Historical	Any intact archaeological remains identified at the property have the potential to contribute to our understanding of the early development of the Penrith business district and its evolution from a farming landscape to a commercial centre. Archaeological resources associated with Phase 1 would contribute to our knowledge about early farming Penrith, though remains associated with Phase 1 are unlikely to be located within the study area. Nineteenth-century building footings, undocumented subsurface features, remains of outbuildings associated with Phase 2 and evidence of continued use/modification during Phase 3 have potential to contribute to the knowledge of building materials and construction techniques in use in Penrith at the time, which was originally located at a considerable distance from the township of Sydney and its readily available building materials and craftsmen. Early twentieth century building footings and remains of outbuildings from Phase 3 may show the development of building techniques in Penrith as it became wealthier and more connected to Sydney via the railway. Artefact bearing deposits found in yard scatters, rubbish pits or undocumented cesspits, cisterns or wells have potential to contribute to our knowledge about the early residents and businesses in the study area. These deposits could be associated with the Phase 2 Henry Street shops and High Street outbuildings, as well as the Phase 2 Price/Priddle business and High Street outbuildings. It is likely that artefact-bearing deposits will date from the late nineteenth to mid-twentieth century, when Penrith was undergoing rapid development. If found to be intact, archaeological remains associated Phase 2 and ongoing use of those structures during Phase 3 have the potential to reach the **local** significance threshold under this criterion. Archaeological evidence associated with Phase 3 and Phase 4 development of the study area is unlikely to reach the local significance threshold. The demolition and subsequent redevelopment of the Penrith commercial district is well documented, and archaeological evidence is unlikely to further contribute to knowledge of the Post-War history of the area.
B) Associative	Archaeological remains of the Phase 2 livery stables/blacksmiths shop within the study area would be associated business owners and residents of Penrith, particularly the Price and Priddle families. The Priddles were a well-known family in business in Penrith during the nineteenth century, while the Prices were associated with John Price & Son, a funeral business that had operated out of Penrith since 1855. Archaeological evidence associated with the businesses and activities of the Priddle and Price families has the potential to reach the **local** significance threshold under this criterion.
C) Aesthetic or Technical	Archaeological remains have the potential to be intact and highly legible. These remains may have distinctive/attractive visual qualities, that are considered to be 'important in demonstrating aesthetic characteristics and/or a high degree of creative or technical achievement in NSW.' Potential archaeological remains including nineteenth century

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Criterion	Discussion
	building footings, undocumented structures, cisterns, wells or rubbish pits and the livery stables/blacksmith's shop in Phase 2 and evidence of continued use/modification of those structures during Phase 3 would represent building techniques and farming practices in the nineteenth and early twentieth century but would be unlikely to demonstrate any outstanding aesthetic or technical achievement. Artefact bearing deposits found in yard scatters, rubbish pits or undocumented cesspits, cisterns or wells may contribute to the knowledge of the activities conducted in the area, such as the livery stables/residence or blacksmith's shop from Phase 2 but are unlikely to possess any aesthetic or technical merit. Archaeological evidence is unlikely to reach the local significance threshold under this criterion.
D) Social	Potential archaeological remains associated with the early development of the study area are likely to have social significance amongst members of the surrounding community, as well as individuals or associations such as historical societies interested in the nineteenth century development of Penrith. Archaeological remains associated with Phase 2 showing the nineteenth century expansion of Penrith have the potential to reach the **local** significance threshold under this criterion.
E) Research Potential	The study area has the potential to contain artefact-bearing deposits associated with the outbuildings from Phase 2 and 3 and the livery stables/blacksmith's shop from Phase 2. Archaeological analysis of deposits of this type can recover data that may be utilised in the analysis of business owners and working families in the nineteenth and early twentieth century. This is especially pertinent to the livery stables/residence, as a known dwelling in the study area. Artefacts from these deposits have the potential to provide information relating to the taste, function, and habits of these classes, which are typically under-represented in the historical record. Potential intact archaeological remains, especially intact artefact bearing deposits associated with the occupation of the study area in Phase 2 would reach the **local** significance threshold under this criterion. It is unlikely that remains of the Phase 4 Post-War demolition and redevelopment would provide any new information about construction techniques in the twentieth century, a topic that is already well documented and extant. It is also unlikely that nineteenth century building remains or subsurface features would offer further knowledge concerning Victorian construction techniques. Archaeological evidence of this type would not reach the local significance threshold.
F) Rarity	There is no evidence to suggest archaeological remains associated with occupation within the study area would be considered unusual or unique. Artefact-bearing deposits from the nineteenth and early twentieth century and the artefacts they contain tend to be of standard types and are well-represented in the archaeological record. Though Penrith was located a great distance from Sydney in the late eighteenth and early nineteenth century and may have developed unique construction techniques or materials during this time, it is unlikely that these would be demonstrated through demolition fills, building footings or undocumented subsurface structures, all standard features of colonial architecture. Archaeological evidence is unlikely to reach the local significance threshold under this criterion.
G) Representativeness	It is expected that potential archaeological remains, including sandstone or brick footings of outbuildings associated with Phase 2 and Phase 3 would be representative of Victorian era commercial structures and that potential artefact bearing deposits would contain somewhat typical artefacts, including glass, metal and ceramic artefacts. If found to be intact, archaeological remains associated with the nineteenth century development of Penrith have the potential to reach the **local** significance threshold under this criterion.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Criterion	Discussion
	Though archaeological remains of the Post-War demolition and redevelopment would be representative of mid-twentieth century commercial expansion in the Penrith region, archaeological remains from this period are unlikely to be fine examples of their type. Archaeological evidence of this type is unlikely to reach the local significance threshold under this criterion.

6.5 Statement of archaeological significance

Residential occupation of the site by the Priddle family occurred between 1888 and 1908. As the residence was established prior to the introduction of municipal stormwater and waste removal services starting in 1890, the study area has the potential to contain artefact-bearing deposits associated with discard practises (i.e. within rubbish pits and/or artefact scatters incorporated into yard surfaces) and opportunistic discard within abandoned wells, cisterns and/or privies/cesspits.

Should artefact-rich soil deposits be identified, based on archaeological results obtained from similar sites, analysis is likely to provide data which can contribute to our understanding of the preferences, socio-economic standing, gender and ethnicity of the occupants of the site. Artefacts obtained from the secure deposits therefore have the ability to respond to research agendas and provide useful information regarding the former occupants of the site. As the residential history of the study area is well documented, remains have the potential to be directly associated with the Priddle family, who contributed to the early development of Penrith.

The study area, therefore, has the potential to contain archaeological 'relics,' as protected by relic provisions of the *Heritage Act 1977* in the form of artefact-bearing deposits associated with the occupation of the study area by the Priddle family between 1888-1908.

6.6 Summary of archaeological potential and significance

Overall, portions of the study area have **low-moderate** potential to contain an archaeological resource associated with Phase 2 occupation and continued use in Phase 3 that would reach the local significance threshold and be considered 'relics' under the Heritage Act (amended 2009) (see Section 3.3.3 and Figure 40).

The north-western portion of the study area has **moderate** potential to contain remains associated with the Phase 2 Ransley/ Priddle/Price livery stables/residence, lolly shop and blacksmith's shop and ongoing use of these buildings during Phase 3 occupation.

The southern portion of the study area is likely to have been subject to varying levels of disturbance associated with the extensive car parking facilities established in the 1960s and modified in the 1980s and 2017. This portion has **low** potential to contain archaeological resources associated with Phase 2 development (outbuildings) and ongoing use of this development during Phase 3 occupation.

A summary of the archaeological potential and significance of the study area is outlined in Table 6. A map showing the areas of archaeological potential within the study area is provided in Figure 41.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Table 6: Overview of archaeological potential and significance

Phase	Potential remains	Potential	Significance
Phase 1: Early Land Grants (1789 – c1850)	Postholes demonstrating the location of former fence lines Evidence of land clearance (tree boles)	Nil Nil	Local (if present and intact)
Phase 2: Nineteenth Century Commercial Development (c1850 – c1900)	Documented building foundations and footings associated with the Ransley/Price/Priddle livery stables/residence/blacksmith's shop and additional c1880 Henry Street shops Undocumented subsurface features i.e., drains, basements, cesspits, cisterns and wells associated with the Price/Priddle livery stables/residence/blacksmith's shop Building foundations and footings associated with the High Street outbuildings Undocumented subsurface features i.e., basements, cesspits, cisterns and wells associated with the High Street outbuildings In situ artefact bearing deposits	Moderate Moderate Low Low	Local (relics)
Phase 3: Early Twentieth Century Commercial Development (c1900 – c1950)	Ongoing use of the Ransley/Price/Priddle livery stables/residence/blacksmith's shop Ongoing use of undocumented subsurface features i.e., basements, cesspits, cisterns and wells associated with the Price/Priddle livery stables/residence/blacksmith's shop Ongoing use of building foundations and footings associated with the High Street outbuildings Ongoing use of undocumented subsurface features i.e., basements, cesspits, cisterns and wells associated with the High Street outbuildings	Moderate Moderate Low Low	Local (ongoing use of Phase 2 buildings only) Not significant (all post-Phase 2 development)

7.0 BUILT HERITAGE ASSESSMENT

7.1 Assessment of significance

This section contains the descriptions, significance assessments and statements of significance for the listed and unlisted heritage items within and around the study area. The significance assessment and statement of significance for all listed items has been extracted from the relevant SHI entry for each item.

7.1.1 Penrith Council Chambers (former) (Penrith LEP 2010 Item No. 189)

7.1.1.1 Description

Constructed from 1959 and designed by A. Hodgson in the Inter-War Moderne / Functionalist style of architecture, the former Penrith City Council chambers features a central double storey reception hall with a figurative decorative terrazzo floor incorporating the council's coat of arms. The building comprises red brick with a textured surface, steel framed windows and doors and a roof hidden behind a parapet. The main entrance is set back from the street, behind a landscaped forecourt with water feature. Internally, the structure features meeting halls and offices, whilst a caretakers flat / office on the eastern wing was a later addition.

7.1.1.2 Assessment of significance

The assessment of significance for the Penrith Council Chambers (former) item (Penrith LEP 2010 Item No. 189) is shown below.

Table 7. Assessment of significance against the NSW Heritage assessment criteria

Criterion	Discussion
A) Historical	*The building demonstrates a phase in the development of the Nepean region following the amalgamation of numerous rural councils. The completion of the building coincides with the incorporation of Penrith City Council in 1959 and marked a return to a form of centralised government on which Penrith had been founded in the early nineteenth century.*
B) Associative	*This item does not reach the local significance threshold under this criterion.*
C) Aesthetic or Technical	*The building is an example of the inter-war Moderne /Functionalist style of architecture set within a landscaped forecourt.*
D) Social	*This item does not reach the local significance threshold under this criterion.*
E) Research Potential	*This item does not reach the local significance threshold under this criterion.*
F) Rarity	*The building was the first chambers of the newly incorporated City of Penrith Council, and formed the focus for the planning and administration of post war expansion in the Nepean region. The scale and style of the building is unique in the LGA.*
G) Representativeness	*The building is representative of a style of architecture developed and popularised in the 1930s and early 1940s.*

7.1.1.3 Statement of significance

The statement of significance for the Penrith Council Chambers (former) item (Penrith LEP 2010 Item No. 189) is as follows:

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

The former Penrith City Council chambers, completed in 1959, was the first chambers of the newly incorporated City of Penrith Council, and formed the focus for the planning and administration of Post-War expansion in the Nepean region. The former chambers demonstrate a phase in the development of the Nepean region following the amalgamation of numerous rural councils and marked a return to a form of centralised government on which Penrith had been founded in the early nineteenth century. The building is an example of the Inter-War Moderne / Functionalist style of architecture set within a landscaped forecourt.[49][50]

7.1.2 TAFE Building (Penrith LEP 2010 Item No. 689)

7.1.2.1 Description

The TAFE Building was designed by E.H. Farmer (NSW Government Architect) and opened on 5 June 1961. The structure is a two-storey building with reinforced concrete frame, stoned coursed wall treatment and aluminium framed glazed walls. It comprises a public foyer with reinforced concrete staircase and is set back slightly from the street behind a narrow, landscaped courtyard and low brick wall. In addition, the low-lying nature of the building is accentuated by the strongly defined horizontal roof line.

7.1.2.2 Assessment of significance

The assessment of significance for the for the TAFE Building item (Penrith LEP 2010 Item No. 689) is shown below.

Table 8. Assessment of significance against the NSW Heritage assessment criteria

Criterion	Discussion
A) Historical	*The building demonstrates a phase in the development of the Nepean region following the amalgamation of numerous rural councils. The completion of the building coincides with the incorporation of Penrith City Council in 1959 and marked upgrade of government services following the County Cumberland Plan of 1955. The role of the building in providing instruction in trades and services coincides with the importance of Penrith as a place of industry.*
B) Associative	*This item does not reach the local significance threshold under this criterion.*
C) Aesthetic or Technical	*The building is an excellent example of the International style of architecture favoured by the NSW Government Architect at the time.*
D) Social	*This item does not reach the local significance threshold under this criterion.*
E) Research Potential	*This item does not reach the local significance threshold under this criterion.*
F) Rarity	*The building in its role and architectural design is unique in Penrith LGA.*
G) Representativeness	*The building is representative of the output of the NSW Government Architect.*

[49] Office of Environment and Heritage, 2005. 'Penrith Council Chambers (former)'. Accessed online December 2020: https://apps.environment.nsw.gov.au/dpcheritageapp/ViewHeritageItemDetails.aspx?ID=2260189

[50] 'It is noted that the Penrith Former Council Chambers site is currently under investigation to establish the redevelopment potential of the site, including progressing through an Architectural Design Excellence Competition process. Any proposed changes to the Former Council Chambers building will be subject to a thorough merit based assessment, including further heritage impact assessment' (Penrith Council, *pers comm* 27 January 2021)

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.1.2.3 Statement of significance

The statement of significance for the TAFE Building item (Penrith LEP 2010 Item No. 689) is as follows:

> *The TAFE Building is one of the first post-1960s modern civic buildings erected in Penrith designed in the International architectural style, at the onset of the growth of the town into a regional city. The building is an excellent example of the work of the NSW Government Architect (E. H. Farmer) at the time and is rare within the LGA. The building is located within a precinct of former centres of local and county levels of government administration, this building demonstrating a layer of State Government administration. The role of the building in providing instruction in trades and services coincides with the importance of Penrith as a place of industry.*[51]

7.1.3 Prospect Electricity Building (former) (Penrith LEP 2010 Item No. 701)

7.1.3.1 Description

The former Prospect Electricity Building was designed by Leslie J Buckland and Druce in the c1960s. The structure is a three-storey office block at the corner of Station and Henry Streets, Penrith, directly opposite the former Penrith City Council Chambers. It comprises reinforced concrete with expressed grid posts and beams with glazed panelled infill. The lower and upper areas of the façade have been altered.

7.1.3.2 Assessment of significance

The assessment of significance for the former Prospect Electricity Building item (Penrith LEP 2010 Item No. 701) is shown below.

Table 9. Assessment of significance against the NSW Heritage assessment criteria

Criterion	Discussion
A) Historical	*The building demonstrates a phase in the development of the Penrith with the formation of regional electricity supply. The completion of the building coincides with the marked upgrade of government services following the County Cumberland Plan of 1955 and the onset of Penrith's accelerated industrial, commercial and residential development of the 1960s.*
B) Associative	*This item does not reach the local significance threshold under this criterion.*
C) Aesthetic or Technical	*The building is a representative example of the International style of architecture. The façade of the building contributes to the townscape values of Penrith CBD.*
D) Social	*This item does not reach the local significance threshold under this criterion.*
E) Research Potential	*This item does not reach the local significance threshold under this criterion.*
F) Rarity	*The building in its role, scale and architectural design is unique in Penrith LGA.*
G) Representativeness	*This item does not reach the local significance threshold under this criterion.*

[51] Office of Environment and Heritage, 2005. 'TAFE Building'. Accessed online December 2020: https://apps.environment.nsw.gov.au/dpcheritageapp/ViewHeritageItemDetails.aspx?ID=2260689

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

7.1.3.3 Statement of significance

The statement of significance for the former Prospect Electricity Building item (Penrith LEP 2010 Item No. 701) is as follows:

> *The former Prospect Electricity Building is a post-1960 modern civic building erected in Penrith and exemplifies the growth of the town into a regional city. The building is a representative example of the International style of architecture which is unique in the Penrith LGA. The building is located opposite the former Penrith Council Chambers and the pair form a precinct of former centres of local and county levels of government administration.*[52]

7.1.4 John Price & Son Funeral Home (former) (unlisted potential heritage item)

7.1.4.1 Description

The former John Price & Son funeral home was built by William Frederick Smith in c1954, beginning operations in November of that year. The structure is a single-storey Flemish bond brick Post-War structure with ornamental brick detailing. A courtyard-style parking bay is positioned in the rear yard of the property.

The Station Street elevation comprises a double-faced Flemish bond brick façade with double hipped roof constructed with terracotta-coloured tiles. Two double-hung timber sash dormer windows are positioned on the southern portion of the roof, with a single timber bay window and three double-hung sash windows on the ground floor. Two bow windows flank the glass front doors, with a single ornamental brick diamond set between the doors and the northern bow window. Further ornamental brick detailing in a triangular design is present underneath the bay window.

The Henry Street elevation comprises a single-faced Flemish bond brick facade with two attached garages on the northern end; the northernmost garage extends to the rear of the property and features a sloped terracotta tile roof, while the second garage extends approximately 5m to the rear of the property and features a flat corrugated iron roof. One narrow and one wide timber double-hung sash window are positioned on the southern end of the elevation, with two unusual pointed-arch stained glass windows flanking the wooden double doors. The windows, which indicate the presence of an interior chapel, are made of red and yellow stained glass and feature a stylised cross design.

Internally, the building is in good condition and appears to substantially retain internal features such as cornices, window fittings and finishes. Floorboards are the main flooring throughout the building, with minor areas of damage evident in the front parlour. It is likely that the utilitarian interior design of the building remains true to its original form and operation. Light fittings appeared to post-date the construction of the building.

The structure is set slightly back from the street with a low brick wall with ornamental detailing and crushed-gravel courtyard. An unusual brick fountain with an octagonal brick base is positioned in front of the Station Street entrance.

7.1.4.2 Assessment of significance

The following assessment of significance of the 'John Price & Son funeral home (former)' unlisted heritage item is based on historical research and a site inspection and is presented in Table 10 below.

Table 10: Significance assessment for 'John Price & Son funeral home (former)'

Criterion	Explanation
A – Historical Significance	The former funeral home has historical significance at a local level. John Price & Son is historically associated with the development of Penrith and the local area's funeral industry. The building, constructed 100 years after the founding of the Price & Son business, shows the growth of funerary practices and customs in the area. The building represents the Post-War evolution of Penrith's commercial district. The long-term occupation of the building by John Price & Son and its continuous use as a funeral home is rare in the Penrith area, with many buildings surrounding the study area dated to the late twentieth century. The importance of the funeral home and its role in the evolution of Perth's commercial district during the twentieth century contributes to its historical significance. The item has **local** significance under this criterion.
B – Associative Significance	The former funeral home is associated with John Price & Son, a local funeral business that has operated in the Penrith area for over 150 years. Moving from its original position in High Street to the current property in the 1950s, the structure was purpose-built for local funerals arranged by John Price & Son until 2014. This long association with a single business is of great significance to the local community. The item has **local** significance under this criterion.
C – Aesthetic or Technical Significance	The former funeral home displays a high level of aesthetic significance, with an eclectic mixture of architectural features from a number of period styles including Post-War, Interwar, Art Deco and Federation. The building's purpose as a funeral home is indicated by aspects of religious architecture to the chapel, including pointed-arch stained glass windows with stylised cross elements. The structure is constructed in multi-coloured "Chromatex" brick, including moulded and curved varieties, which were a new and popular material at the time. Both externally and internally the building appears to be substantially intact, with the relatively modest interiors indicative of the restrained and utilitarian nature of the space excepting the chapel room. A highly unusual octagonal brick fountain in the Station Street courtyard is contributory to the item's aesthetic significance. The item has **local** significance under this criterion.
D – Social Significance	The former funeral home has the potential to contribute to the local community's sense of place and can provide a connection to the local community's past. As a locally-recognised name in the funerary industry, John Price & Son has conducted the funerals of local residents since its establishment in 1855. The business operated within this purpose-built funeral home from 1954-2014. A strong association is present between the structure, the business, residents of the local area and other stakeholders such as local historical societies. The item has **local** significance under this criterion.
E – Research Potential	The former funeral home is unlikely to provide further knowledge about funerary techniques or practices in the twentieth century; this topic is already well-documented in the historical record. The item does not meet the threshold for significance under this criterion.
F – Rarity	The unusual combination of architectural styles present within the structure are unique for a Post-War building. The bay and dormer style windows are reminiscent of earlier Federation/Interwar style architecture, while the pointed-arch stained glass windows are more typical of religious buildings. These window styles, combined with a highly

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Criterion	Explanation
	ornamental “Chromatex” brick and Flemish bond, produce a rare and eclectic building that is highly contributory to the streetscape. The item has **local** significance under this criterion.
G – Representativeness	The former funeral home is representative of the increasing professionalisation of funerary practices in Australia following the Second World War, as funerals moved away from the domestic sphere and became a recognised industry. The item has **local** significance under this criterion.

7.1.4.3 Statement of significance

The former John Price & Son funeral home is of local heritage significance.

The funeral home, completed in 1954, is the oldest continuously-used purpose-built funeral home in Penrith, showing the changing attitudes towards funerary practices and customs in the area. The funeral home is associated with a local funeral business founded by John Price in Penrith in 1855, which moved from High Street to its current location in the 1950s. The Post-War building features an eclectic mixture of architectural styles, including Interwar, Art Deco and Federation features such as bay and dormer windows. The religious aspect of funerals is also shown in the religious architectural features of the Station Street elevation, which include pointed-arch stained glass windows with stylised cross elements. This combination of architectural styles makes the building unique in the Penrith LGA and a distinctive item in the streetscape. A highly unusual octagonal brick fountain in the Station Street courtyard is contributory to the item’s aesthetic significance.

7.1.4.4 Grading of heritage significance

The different elements of a structure or place contribute to its overall heritage value. The loss of one or more of these components may diminish the overall significance of the item. Specifying the contribution that a component makes to the overall heritage significance of a structure or place provides a useful framework for its management.

The NSW Heritage Office’s publication *Assessing Heritage Significance* (2001) outlines appropriate terminology and justification for grading individual components, and the implications that this grading has to an item or landscape’s significance (Table 11).

Table 11. Standard grades of significance.

Grading	Justification	Status
Exceptional (E)	Rare or outstanding element directly contributing to an item’s local and State significance.	Fulfils criteria for Local or State listing.
High (H)	High degree of original fabric. Demonstrates a key element of the item’s significance. Alterations do not detract from significance.	Fulfils criteria for Local or State listing.
Moderate (M)	Altered or modified elements. Elements with little heritage value, but which contribute to the overall significance of the item.	Fulfils criteria for Local or State listing.
Little (L)	Alterations detract from significance. Difficult to interpret.	Does not fulfil criteria for Local or State listing.
Intrusive (I)	Damaging to the item’s heritage significance.	Does not fulfil criteria for Local or State listing.

8.0 IMPACT ASSESSMENT

8.1 Introduction

The following section provides an assessment of the impacts that proposed development will have on heritage listed items, one unlisted item and potential archaeological remains within and around the study area.

This assessment has been prepared in accordance with the guidelines provided by the NSW Heritage Council and seeks to evaluate and explain how the proposed works may impact the heritage significance of the place, and comment on the necessity of negative impacts and mitigation measures (see Section 2.4).

8.2 Proposal

Council has proposed to establish a City Park at the corner of Station Street and Henry Street, Penrith. The City Park will be a vibrant green space that is a destination for residents, workers and visitors and a stimulant for the day- and night-time economy of the area. The proposal would involve the demolition of all existing structures within the study area and remediation of the site.

The properties affected by the proposal are:

- Lot 3 DP 1200790
- Lot 1 DP 526304
- Lot E DP 163176
- Lot 2 DP 556075
- Lot 10 DP 5536655
- Lot 11 DP 5536655
- Lot 1 DP 164798
- Lot 1 DP 252457
- Lot 1 DP 254763.

Key features of the proposal include the following:

- Demolition of all existing structures within the study area
- Remediation of the study area and earthworks
- Construction and re-surfacing of the impacted road pavement
- Installation of an irrigated central lawn
- Installation of WSUD, upgrade kerb and gutters
- Recycled brick paving
- Landscaping including the planting of super advanced trees and mass planting
- Installation of smart park elements
- Waste innovation (for properties adjacent to the park)
- Installation of custom designed amenities building with storage, a performance space and pergola

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

- Design and installation of sustainable water feature (or water features) with interactive elements
- Public art
- Quality and durable fixtures, fittings, and furniture (i.e., seating, bubblers, display banner poles, lighting)
- Installation of signage distinct to Penrith.

An overview of the current design plan for the proposal is included in Figure 45, with artists impressions of the park provided as Figure 46 and Figure 47.

The impacts of the key elements of the proposed works described above are assessed in Section 8.5. Impacts are separated into potential direct (physical) impacts and potential indirect (visual) impacts to items as a result of the proposal, with assessment terminology used as outlined in Table 3.

8.3 Design development

The current design will be submitted to Council with a Development Application (DA) for the proposed City Park.

8.4 Project justification

The construction of a City Park has been considered an important component in the transformation of Penrith City Centre since 2006. It was identified in the Penrith Progression Action Plan as a key project for promoting growth, development, activation and to create more vibrancy in the city centre.

City Park will be approximately 7,000sqm on the corner of Station Street and Henry Street, Penrith. The location of City Park is a prime central location for an iconic City Park, a short walk from Penrith Train Station and Westfield, and immediately opposite the former Council Chambers. The City Park location is perfectly situated to support and compliment future city centre investment and development.

The park will provide benefits during the day for city centre workers and shoppers and in the evening, activating the city's restaurants and other social opportunities. City Park will attract visitors to the city centre and encourage residents and workers to get outside, exercise and connect with one another.

City Park is identified in Councils Operational Plan as priority project. As such, the concept design has been completed to enable the project to move to the detailed design stage in January 2021. Construction of City Park will begin in late 2021 and will be completed in early 2023.

8.5 Assessment of heritage impact

The following assessment of heritage impacts has focused on those aspects of the proposed works with the potential to impact on listed and unlisted heritage items within and around the study area.

8.5.1 Impact on listed items

There are three listed heritage items of local significance in the vicinity of the study area. The Penrith Council Chambers (former) (Penrith LEP 2010 Item No.189) is located approximately 15 m north of the study area, the TAFE Building (Penrith LEP 2010 Item No.689) is located approximately 15 m northeast of the study area and the Prospect Electricity Building (former) (Penrith LEP 2010 Item No. 701) is located approximately 16 m west of the study area.

8.5.1.1 Direct (physical) impacts

The proposed works associated with the Penrith City Park project involve large-scale demolition of all properties within the study area to facilitate the construction of a city park. The listed heritage items are positioned outside the study area at a distance of more than 10 m and will not be physically altered as a result of the demolition works.

However, there is some potential for the three heritage listed items to experience vibration levels above the cosmetic damage screening criteria during the bulk demolition and remediation works. Further assessment (including a vibration risk assessment) and vibration monitoring (if required) is recommended.

Assuming vibration impacts would be mitigated during the works period, the proposed works would result in an overall **neutral** direct (physical) impact to the three locally significant listed items.

8.5.1.2 Indirect (visual) impacts

The proposed works associated with the Penrith City Park project involve the demolition of all existing structures within the study area. All listed heritage items have direct views towards the study area's Post-War commercial development, including the John Price & Son funeral home. The heritage items were constructed in the late 1950s-1960s, a decade after the construction of the majority of the buildings within the study area. The demolition of these structures would alter the wider setting of all three heritage items, removing the existing views and altering the visual character of the area.

However, the proposed works do not involve the construction of new vertical elements or large obtrusive structures, and instead involve the development of a city park with green spaces. Any new structures would be low-rise and set back from the street as to maintain the current view lines to and from heritage items. The views from the listed heritage items, therefore, would not be further obscured by modern structures and may be opened up by the presence of an open space. As the development will not significantly obscure the views with permanent vertical structures, the visual impact of the works is minimized.

The proposed works would result in an overall **minor** indirect (visual) impact to the three locally significant heritage items.

8.5.2 Impact on unlisted potential heritage item

There is one unlisted potential heritage item located within the north-western portion of the study area at the corner of Station and Henry Streets (John Price & Son Funeral Home [former]). This item will be demolished as part of the proposal.

8.5.2.1 Direct impacts

The proposed works associated with the Penrith City Park project involve the complete demolition of the former John Price & Son funeral home. This would remove all significant fabric of the funeral

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

home, courtyard and associated outbuildings and would remove all significance associated with the property as assessed in Section 7.1.4.

Overall, the proposed works would result in a **major** direct (physical) impact to the John Price & Son Funeral Home (former) and would result in total loss of significance of the property.

8.5.2.2 Indirect (visual) impacts

The proposed works associated with the Penrith City Park project involve the complete demolition of the former John Price & Son funeral home. This would remove all visual characteristics of the funeral home, courtyard and associated outbuildings as well as views to and from the property. The demolition would remove all aesthetic heritage values associated with the property as assessed in Section 7.1.4.

Overall, the proposed works would result in a **major** indirect (visual) impact to the John Price & Son Funeral Home (former) and would result in total loss of significance of the property.

8.6 Archaeological impact assessment

The demolition methodology will be confirmed by the Demolition and Remediation consultant at a later stage of the project. The methodology for removal of extant structures and the degree of bulk earthworks following removal is therefore unknown at this stage.

An updated archaeological impact assessment should be prepared as part of the archaeological research design (ARD) process once the demolition methodology has been prepared and/or further information on the extent of bulk earthworks and other ground-disturbing activities during the demolition process is known.

8.6.1 Penrith Development Control Plan 2014

The Penrith DCP 2014 contains controls and recommendations for the conservation of heritage items and development within the vicinity of heritage items and conservation areas. The objectives of the controls are to ensure that the development of land or a building in the vicinity of a heritage item or heritage conservation area is undertaken in a manner that complements the heritage significance of the site or area. The controls also aim to introduce detailed urban design controls and guidelines which aim to retain the built forms of the streetscape and help guide new development within the existing streetscape.

The report recommends that any future works comply with the controls set within the DCP. These design controls and their assessment against the proposal are outlined in Table 14.

Table 14: Penrith DCP 2014 controls

Control	Assessment
a) To conserve and maintain established setbacks to streets	The proposal would be set back from the street as to not impose upon view lines to and from heritage items. Any new additions would be low-rise as to maintain the current Post-War setting of the surrounding area. The proposed use of the study area would open view lines between and towards surrounding heritage items.
b) To ensure adequate curtilage and landscape setting for the item	The proposal would not encroach upon the heritage curtilages of heritage listed items within the vicinity of the study area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Control	Assessment
c) To ensure the integrity of the heritage item and its setting, or the conservation area, is retained	The proposal would take into consideration the Post-War architectural style of the surrounding area and endeavour to maintain current view lines to and from heritage items. The proposed use of the study area would potentially open view lines between and towards surrounding heritage items.
d) by the careful siting of new buildings and alterations and additions to existing buildings	There would be no direct (physical) impact to listed heritage items as a result of the proposal. Any new structures would be low-rise and set back from the street as to maintain the current view lines associated with the listed heritage items.
e) To ensure that the subdivision of land on which a heritage building is located does not isolate the building from its setting or context, or adversely affect its amenity or privacy	The proposal would not encroach upon the heritage curtilage of heritage listed items within the vicinity of the study area.
f) To ensure that the development of land or a building in the vicinity of a heritage item is undertaken in a manner that complements the heritage significance of the site	The proposal would take into consideration the Post-War architectural style of the surrounding area and, where possible, consider brickwork within the proposal (i.e., brick paving) to tie in with the Post-War aesthetic character of the surrounding area and heritage item.
g) To ensure that new development is carefully sited so as to avoid causing physical damage to any heritage item especially where sited within the same curtilage as the heritage item	The proposal would not encroach upon the heritage curtilage of heritage listed items within the vicinity of the study area.
h) To ensure that new development, including alterations, additions, extensions, additional buildings or structures, are designed to minimise any potential impacts to adjoining heritage items	The proposed use of the study area is in keeping with the surrounding area and final design would aim to minimise impacts to adjoining heritage items.
i) To protect the heritage significance of heritage items and items within heritage conservation areas	The proposal would not encroach upon the heritage curtilage of listed heritage items within the vicinity of the study area. The proposal is not expected to cause a heritage impact level above minor to heritage items within the vicinity of the study area.
j) To conserve and protect significant items of European heritage that are located in the industrial areas of the City	The proposal would not encroach upon the curtilage of listed heritage items and is not expected to cause a heritage impact level above minor to heritage items within the vicinity of the study area.
k) To prevent the demolition of heritage items or items within heritage conservations areas	The proposal would not result in the demolition of heritage listed structures, though one unlisted item of local heritage significance will be demolished. The unlisted heritage item will be majorly impacted, resulting in total loss. The proposal is not expected to cause a heritage impact level above minor to listed heritage items within the vicinity of the study area.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Control	Assessment
l) To ensure that new development located within the curtilage of a heritage item is in keeping with the context and setting of the heritage item	The proposal would take into consideration the Post-War architectural style of the surrounding area. New structures should be low-scale and set back from the street as to not impose upon view lines to and from heritage items. In addition, brickwork should be considered in the proposal (i.e., brick paving) to tie in with the Post-War aesthetic character of the surrounding area and heritage items.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

8.7 Statement of heritage impact

A statement of heritage impact has been prepared in accordance with the model provided in the NSW Heritage Division (now Heritage NSW) guidelines which delineates a statement of heritage impact into five key component questions Table 15.[53]

Table 15. Statement of Heritage Impact for the proposed works for the Penrith City Park project

Impact	Discussion
What aspects of the proposal respect or enhance the heritage significance of the study area?	The proposal would not involve the alteration of any listed heritage items surrounding the study area or impinge on their curtilages. The design of the Penrith City Park would take into consideration the Post-War character of the study area, maintaining aesthetic consistency for the three locally significant heritage items where feasible. New structures would not impose upon view lines to and from the heritage items, with the majority of the proposal involving the creation of green space and any structures planned to be low-rise and set back from the street. Additionally, material such as the Chromatex bricks will be considered in the landscaping as visual references to the Post-War aesthetic character of the surrounding area. The retention of the octagonal ornamental fountain, *in situ* if feasible, ensures that a significant aspect of the unlisted heritage item, the John Price & Son Funeral Home, will be protected and incorporated into the development.
What aspects of the proposal could have a detrimental impact on the heritage significance of the study area?	The proposal would result in neutral direct (physical) impacts to the three locally significant heritage items, as the heritage items are located outside of the study area. However, the proposal will demolish all structures within the study area, resulting in the total loss of an unlisted heritage item, the former John Price & Son Funeral Home. This can be partially mitigated by the salvage of significant material, including the Chromatex bricks and stained glass windows, for future use. The octagonal ornamental fountain would also be protected and retained *in situ.* The visual characteristics and settings of the listed heritage items will also be altered by the large-scale demolition; however, as no medium- or high-rise vertical structures are being considered views are not likely to be significantly obscured.

[53] NSW Heritage Division, *Statements of Heritage Impact.* Accessed online https://www.environment.nsw.gov.au/resources/heritagebranch/heritage/hmstatementsofhi.pdf

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

Have more sympathetic options been considered and discounted?	The proposal has been designed to avoid the curtilages of listed heritage items surrounding the study area and will demolish a single unlisted potential heritage item. This has been assessed as the most sympathetic option for the proposed works. An alternative design option, comprising of the complete demolition of the John Price & Son Funeral Home and ornamental fountain was considered. This option would have discarded all significant fabric, including the Chromatex bricks and stained glass windows. This alternative design option was discounted as it would have resulted in the total loss of all significant fabric associated with the unlisted heritage item. An alternative design option, comprising a large built entrance structure to the park at the intersection of Henry Street and Station Street was considered. However, that option was discounted once the decision was made to keep the ornamental fount, with the built structure replaced with a large Fig tree in order to better reflect the 'domestic scale' of the preserved ornamental fountain.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9.0 CONCLUSIONS AND RECOMMENDATIONS

9.1 Conclusions

This HIS has made the following conclusions:

- There are three listed heritage items in the vicinity of the proposed works:
  - Penrith Council Chambers (former) (Penrith LEP 2010 Item No. 189)
  - TAFE Building (Penrith LEP 2010 Item No. 689)
  - Prospect Electricity Building (former) (Penrith LEP 2010 Item No. 701)
- There is one unlisted potential heritage item in the vicinity of the proposed works:
  - John Price & Son Funeral Home (former), assessed as of local significance
- The study area has been assessed as having nil potential to contain locally significant archaeological remains dating to the first European occupation phase of the site (1789 – c1850s), low potential to contain archaeological remains of local significance relating to the mid-late nineteenth century commercial development and occupation of the site (Phase 2: c1850s - c1900) and moderate potential to contain archaeological remains of local significance relating to the early twentieth century commercial development and occupation of the site (Phase 3: c1900-1950). There is potential that these remains would be considered 'relics' under the *NSW Heritage Act 1977.*
- The proposal has been assessed as having a:
  - Neutral direct (physical) impact to the Penrith Council Chambers (former) heritage item
  - Minor indirect (visual) impact to the Penrith Council Chambers (former) heritage item
  - Neutral direct (physical) impact to the TAFE Building heritage item
  - Minor indirect (visual) impact to the TAFE Building heritage item
  - Neutral direct (physical) impact to the Prospect Electricity Building (former) heritage item
  - Minor indirect (visual) impact to the Prospect Electricity Building (former) heritage item
  - Major direct (physical) impact (demolition) to the John Price & Son Funeral Home unlisted heritage item
  - Major indirect (visual) impact (demolition) to the John Price & Son Funeral Home unlisted potential heritage item
  - Potential impact to areas assessed as demonstrating potential for archaeological remains.

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

9.2 Recommendations

The following recommendations would be considered during further development of the proposal design.

General

- Comprehensive photographic archival recording of the interiors and exteriors of the John Price & Son funeral home in accordance with relevant Heritage Division's guidelines should be conducted prior to demolition of the building. The photographic archival recording of each item would be carried out prior to works commencing, and in some cases, during the construction program. It should be prepared in accordance with the NSW Heritage Office's *How to Prepare Archival Records of Heritage Items* (1998), and *Photographic Recording of Heritage Items Using Film or Digital Capture* (2006) by a suitably qualified heritage consultant using archival-quality material.
- A 3D scan or photogrammetry of the John Price & Son funeral home should be considered in addition to the photographic archival recording.
- The ornamental octagonal fountain from the John Price & Son funeral home will be retained *in situ* and protected during works, and form part of the park landscaping following the completion of works.
- The stained glass windows and Chromatex bricks from the John Price & Son funeral home should be salvaged during demolition works.
- Where feasible, the Chromatex bricks from the John Price & Son funeral home should be reused in the park landscaping following the completion of works. If any damage is sustained by the octagonal fountain during works, these bricks may be suitable as replacements.
- A salvage methodology would be prepared for the octagonal fountain, Chromatex bricks and stained glass windows of the John Price & Son funeral home, detailing the specific recommendations for the safety of the items during the demolition process and possible next steps e.g., donation to local historical societies. Structural engineers would be consulted as part of this preparation.
- Opportunities for providing historical interpretive displays in the proposal design would be explored.
- All relevant staff, contractors and subcontractors should be made aware of their statutory obligations for heritage under *NSW National Parks and Wildlife Act 1974* and *NSW Heritage Act 1977*. This may be implemented as a heritage induction.

Archaeology

- As the potential for historical relics has been identified within the study area and the detailed design is currently unknown, archaeological testing under a Section 139 (s139) (1B) Exception permit is recommended. This would inform future designs for the proposal and involve:
  - A s139 (1B) exception permit application would be prepared and submitted to Heritage NSW, DPC for approval prior to works commencing

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

  - The s139 (1B) application will require the preparation of an archaeological research design (ARD), with an archaeological excavation methodology, which would be submitted in support of the permit application. The ARD should include additional primary research where required to inform the excavation methodology, and an impact assessment once the demolition methodology has been prepared by the demolition contractor
  - A program of archaeological test excavation and monitoring would be undertaken in accordance with the s139 conditions and ARD in areas assessed as containing potential for locally significant archaeological remains
  - Results derived from archaeological test excavations would be used to inform future detailed designs for the project including areas that should be avoided by subsurface impacts where feasible.
- If archaeological remains are found during testing and impacts cannot be avoided, a Section 140 Excavation permit would be required from Heritage NSW:
  - A s140 excavation permit application would be prepared and submitted to Heritage NSW, DPC for approval prior to works commencing
  - This would require the preparation of an archaeological research design (ARD), with a historical archaeological excavation methodology, which would be submitted in support of the permit application
  - A program of archaeological salvage excavation would be undertaken in accordance with the s140 conditions and ARD.
- An Unexpected Finds Procedure would be prepared as part of the archaeological investigations. The NSW Heritage Division would be notified of the discovery of a relic in accordance with Section 146 of the NSW Heritage Act 1977.

Vibration impacts

- During construction and demolition works, monitoring of vibration impacts to the locally significant former Council Chambers (Penrith LEP 2010 Item No. 189), TAFE Building (Penrith LEP 2010 Item No. 689) and former Prospect Electricity Building (Penrith LEP 2010 Item No. 701) would be undertaken by structural engineers or a vibration specialist. Assessment and monitoring of vibration impacts would adhere to the:
  - British Standard BS 7385: *Part 2: Evaluation and Measurement for Vibrations in Buildings – Part 2 Guide to Damage Levels from Ground-Borne Vibration*
  - German Standard DIN 4150 *Part 3: Structural Vibration in Buildings: Effects on Structures.*
- If vibration monitors are necessary for listed heritage items, non-invasive adhesive methods such as beeswax would be considered.
- If it is identified that levels of vibration would result in damage to heritage fabric associated with the listed heritage items, works must cease and the construction methodology be

Document Set ID: 9547379

reviewed by project engineers in consultation with a heritage consultant to mitigate further impacts.

LANDMARK
PLANNING

13 April 2021

General Manager
Penrith City Council
P O Box 60
PENRITH NSW 2751

Attn: Peter Wood –Development Services Manager

Dear Peter,

Re: Peer Review – Development Application No. 21/0045 – Proposed Demolition Works & Land Remediation Works – Henry & Station Streets, St Marys

I refer to the above development application which was lodged by Penrith City Council for Demolition Works & Land Remediation Works at 134-144 Henry Street and 42-50 Station Street, Penrith. The works will allow for the future development of the land as a public park, which is subject to a seperate application DA 20/0047.

I have reviewed the development application documentation and the draft Council Report prepared by your Senior Development Assessment Planner Lucy Goldstein. I concur with the findings and recommendations of the draft Council Report.

The provisions of State Environmental Planning Policy No.55 – Remediation of Land have been suitably addressed by way of various investigations including soil, groundwater and vapour analysis; and staged remediation of the site being proposed in accordance with the staged Remedial Work Plans, guided by the overarching Remedial Action Plan which will make the site suitable for the future planned recreational use of the site.

I note that the site is zoned RE1 Public Recreation and B4 Mixed Use under Penrith Local Environmental Plan 2010. The proposal is compatible with the RE1 zone objectives, in particular "*to enable land to be used for public open space or recreational purposes"* and B4 zone objectives, in particular "*to provide a mixture of compatible land uses"* and *"to create opportunities to improve public amenity".*

The proposal is considered demolition and remediation works are permitted under Local Environmental Plan 2010.

Heritage items are located within the vicinity of the site and a potential unlisted item on the subject site. It is noted that the application has been accompanied by a Heritage Impact Statement and on balance, the demolition of the potential item being John Price & Son Funeral Home, has been considered appropriate for the improved public benefit, subject to photographic archiving, retention

Document Set ID: 9547379
Version: 1, Version Date: 14/04/2021

of the ornamental fountain in place, salvage of stained glass windows and bricks and other necessary conditions to protect the adjoining heritage items.

The provisions of DCP 2014 identify the site as a City Park and City Square.

The report notes the presence of a large, well established Lemon Scented Gum and that this tree will be retained and incorporated into the future design of the park, with appropriate conditions recommended to ensure this occurs.

Community consultation occurred and no submissions were received.

I consider that the proposal is well founded and provides a site suitable for future redevelopment as a recreation area, which will provide for improved facilities for the public. The proposal will assist in the revisualisation and improvement of the public areas of Penrith, consistent with the planned location of a new city park.

It is concluded that the proposed works are permissible within the zone and that the assessment has suitably considered the key considerations of Section 4.15 of the Environmental Planning & Assessment Act, 1979. The recommendation and proposed conditions are considered to be appropriate.

Yours faithfully,
